Received 7 February 2012; accepted 12 February 2012

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.020\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.083;  $wR$  factor = 0.224; data-to-parameter ratio = 17.9.

In the crystal of the title polymeric compound,  $[\text{HgI}_2(\text{C}_4\text{H}_5\text{N}_3)]_n$ , the  $\text{Hg}^{II}$  cation is located on a twofold rotation axis and is coordinated by two  $\text{I}^-$  anions and two 2-aminopyrazine ligands in a distorted  $\text{HgI}_2\text{N}_2$  tetrahedral geometry. In the crystal, the 2-aminopyrazine ligand is equally disordered over two positions about an inversion center, and bridges the  $\text{Hg}^{II}$  cations with pyrazine N atoms to form a polymeric chain running along the  $c$  axis. In the polymeric chain, the amino groups link to the coordinated  $\text{I}^-$  anions via intermolecular  $\text{N}-\text{H}\cdots\text{I}$  hydrogen bonds.

## **catena-Poly[[diiodidomercury(II)]- $\mu_2$ -2-aminopyrazine- $\kappa^2N^1:N^4$ ]**

**Sadif A. Shirvan, Mohammad R. Asghariganjeh, Manouchehr Aghajeri, Sara Haydari Dezfuli and Farzaneh Hossini**

### **S1. Comment**

2-Aminopyrazine is a good ligand and numerous complexes with 2-aminopyrazine have been prepared, such as that of silver (Sun *et al.*, 2009), copper (Pagola *et al.*, 2008), cobalt, iron and cadmium (Boonmak *et al.*, 2010) and zinc (Gao & Ng, 2011; Goher *et al.*, 2008). Here, we report the synthesis and structure of the title compound.

The asymmetric unit of the title compound, (Fig. 1), contains one half molecule. The Hg<sup>II</sup> atom is four-coordinated in a distorted tetrahedral configuration by two N atoms from two 2-aminopyrazine and two I atoms. The Hgd-I and Hg—N bond lengths angles are collected in Table 1.

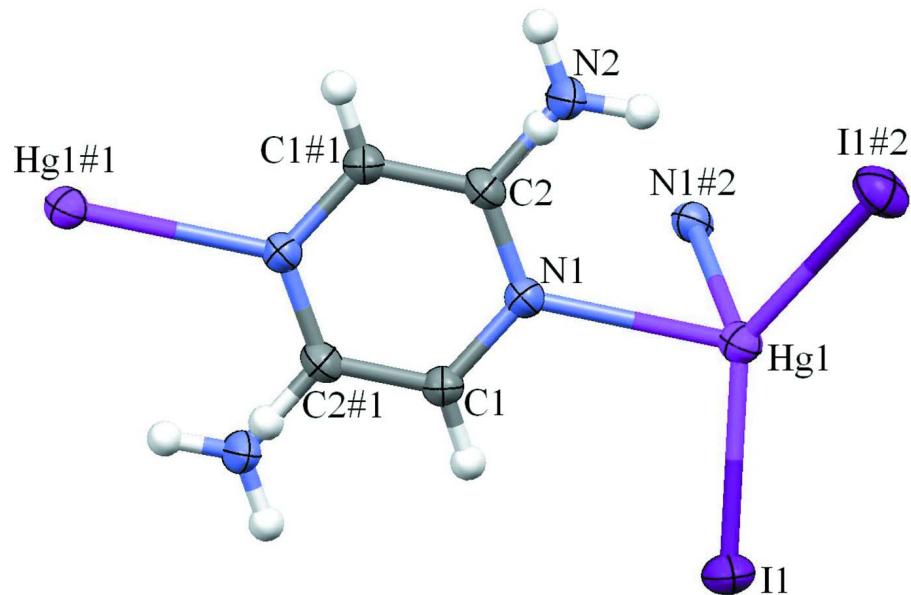

Intermolecular N—H···I hydrogen bonds (Table 2) seem to be effective in the stabilization of the polymeric structure (Fig. 2).

### **S2. Experimental**

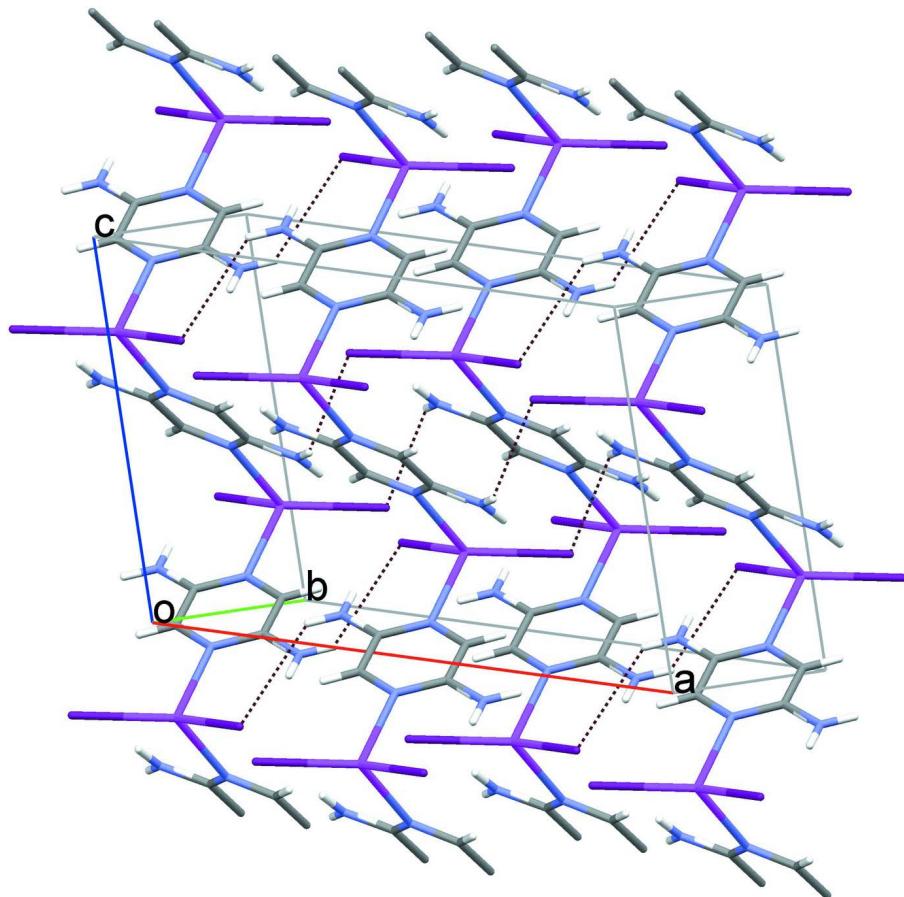

For the preparation of the title compound, a solution of 2-aminopyrazine (0.15 g, 1.50 mmol) in methanol (10 ml) was added to a solution of HgI<sub>2</sub> (0.55 g, 1.50 mmol) in methanol (10 ml) and the resulting colorless solution was stirred for 15 min at room temperature. This solution was left to evaporate slowly at room temperature. After one week, colorless needle crystals of the title compound were isolated (yield 0.63 g, 76.4%).

### **S3. Refinement**

H atoms were positioned geometrically with C—H = 0.93 and N—H = 0.86 Å, and constrained to ride on their parent atoms with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$ . In the crystal, the 2-aminopyrazine ring is equqlly disordered over two positions about an inversion center.

**Figure 1**

The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. [Symmetry codes: #1:  $-x, 1 - y, 1 - z$ ; #2:  $-x, y, 3/2 - z$ ].

**Figure 2**

A packing diagram of the title complex. Hydrogen bonds are shown as dashed lines.

Extinction correction: *SHELXTL* (Sheldrick, 2008),  $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$   
Extinction coefficient: 0.015 (2)

#### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
