Received 31 March 2012; accepted 7 April 2012

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.037;  $wR$  factor = 0.099; data-to-parameter ratio = 12.9.

The title compound,  $C_{33}H_{42}O_5$ , known as xerophenone A [systematic name: (1*R*,3*R*,4*R*,6*S*,8*E*,10*R*)-10-hydroxy-8-[hydroxy(phenyl)methylene]-4-methyl-1,6-bis(3-methylbut-2-en-1-yl)-3-(3-methylbut-3-en-1-yl)-11-oxatricyclo[4.3.1.1<sup>4,10</sup>]-undecane-7,9-dione] is a naturally occurring rearranged benzophenone compound which was isolated from the twigs of *Garcinia propinqua*. The absolute configuration was determined by refining the Flack parameter to 0.18 (16). The absolute configurations at positions 1, 3, 4, 6 and 10 of the xerophenone A are *R*, *R*, *R*, *S* and *R*. In the molecule, the cyclohexane-1,3-dione, tetrahydro-2*H*-pyran and tetrahydrofuran rings adopt twisted boat, standard chair and envelope conformations, respectively. The 3-methylbut-3-en-1-yl substituent is disordered over two sets of sites in a 0.771 (11):0.229 (11) ratio. An intramolecular O—H···O hydrogen bond generates an *S*(6) ring motif. In the crystal, molecules are linked by O—H···O and weak C—H···O interactions into a chain along the *a* axis. A very weak C—H···π interaction and C···O short contact [2.989 (2) Å] are also present.

## Absolute configuration of xerophenone A

**Hoong-Kun Fun, Cholpisut Tantapakul, Surat Laphookhieo, Nawong Boonnak and Suchada Chantrapromma**

### S1. Comment

*Garcinia* belongs to the Clusiaceae family which is well recognized to produce a variety of biological active metabolites including xanthones (Phongpaichit *et al.*, 1994), flavanones (Castardo *et al.*, 2008), terpenoids (Nguyen *et al.*, 2011) and benzophenones (Thoison *et al.*, 2005; Xu *et al.*, 2010). Several of these compounds possess interesting biological and pharmacological activities, such as antimicrobial (Xu *et al.*, 2010), antidepressant and anti-HIV (Xu *et al.*, 2010), antioxidant (Yu *et al.*, 2007) and also cytotoxic (Suksamrarn *et al.*, 2006) activities. During the course of our study of bioactive compounds from medicinal plants, the title compound (I), known as xerophenone A (Henry & Jacobs, 1995) was isolated from the twigs of *G. propinqua* which were collected from Chiang Rai province in the northern part of Thailand. Herein the crystal structure and absolute configuration of (I) was reported.

The title compound (I),  $C_{33}H_{42}O_5$ , is a rearranged benzophenone and an isoprenylated derivative of 11-oxatricyclo-[4.3.1.1<sup>4,10</sup>]undecane-7,9-dione. Figure 1 shows that (I) exists in an *E* configuration with respect to the C8=C27 double bond [1.402 (3) Å] with a C9–C8–C27–C28 torsion angle 177.48 (17)°. In order to view more clearly and gain more information of the ring conformations and the orientations of the rings and how each substituent is in respect to the bound rings, Figure 2 is also shown. It can be clearly seen that the cyclohexane-1,3-dione ring is in a twisted boat with the puckering parameters  $Q = 0.616$  (2) Å,  $\theta = 101.86$  (19)° and  $\varphi = 157.84$  (19)° (Cremer & Pople, 1975), the tetrahydro-2*H*-pyran ring (C1–C4/C10/O5) is in a standard chair conformation and the tetrahydrofuran ring (C4–C6/C10/O5) is in an envelope conformation with the puckering atom O5 of 0.283 (1) Å, and puckering parameter  $Q = 0.4223$  (18) Å and  $\varphi = 1.0$  (3)°. The two 3-methyl-2-buten-1-yl substituents (C11–C15 and C21–C15) are attached to the cyclohexane-1,3-dione moiety at atoms C1 and C6 with the torsion angles C1—C11—C12—C13 = 153.3 (2)° and C6—C21—C22—C23 = -161.87 (19)°, indicating a (+)-anti-periplanar and (-)-anti-periplanar conformations, respectively. The 3-methyl-3-buten-1-yl substituent (C16–C20) is disordered over two positions in a 0.771 (11): 0.229 (11) ratio, and attached to the tetrahydro-2*H*-pyran ring at atom C3 with the torsion angles C3—C16—C17—C18 = 179.6 (3)° for the major component (*A*) and -168.3 (8)° for the minor component (*B*) (Fig. 1). An intramolecular O1—H1O1···O2 hydrogen bond (Table 1) generates an S(6) ring motif (Bernstein *et al.*, 1995). The bond distances in (I) are within normal ranges (Allen *et al.*, 1987). The absolute configuration at atoms C1, C3, C4, C6 and C10 or at positions 1, 3, 4, 6 and 10 of the xerophenone A are *R,R,R,S,R* configurations.

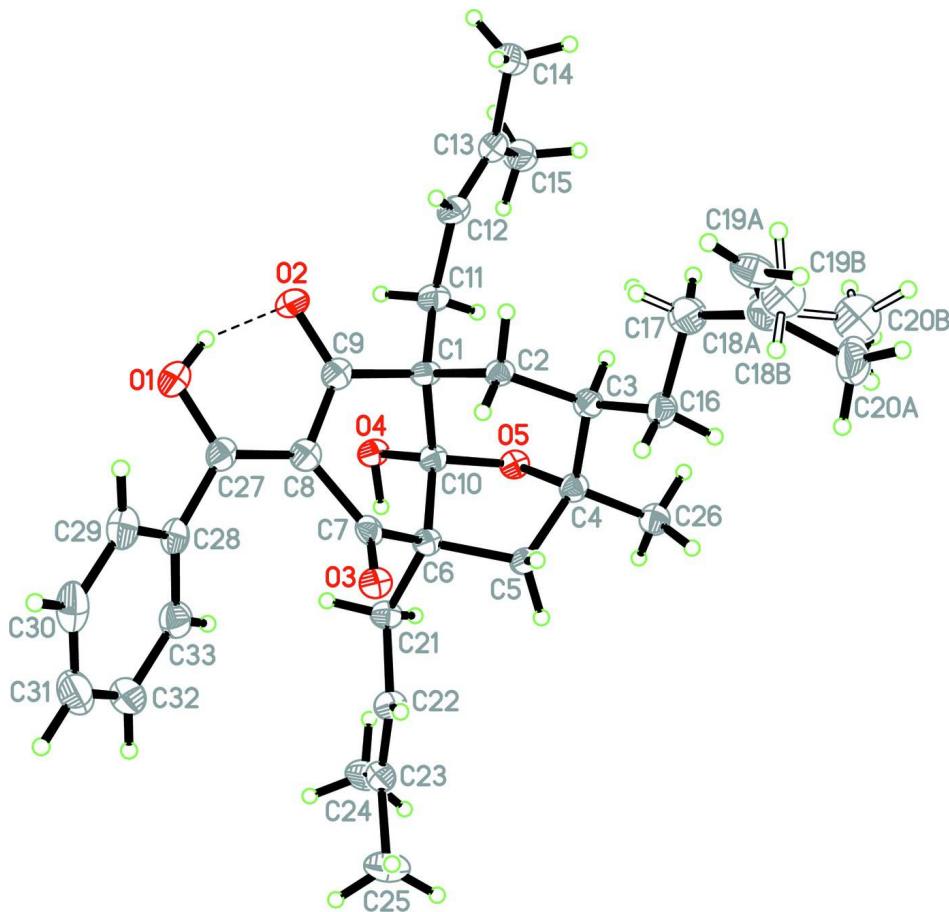

In the crystal (Fig. 3), molecules are linked by O—H···O hydrogen bonds and weak C—H···O interactions (Table 1) forming an  $R^2_1(7)$  motif which connected the molecules into a chain along the *a* axis. A C—H···π interaction (Table 1) and a C27···O4<sup>i</sup> short contact [2.989 (2) Å] are observed.

**S2. Experimental**

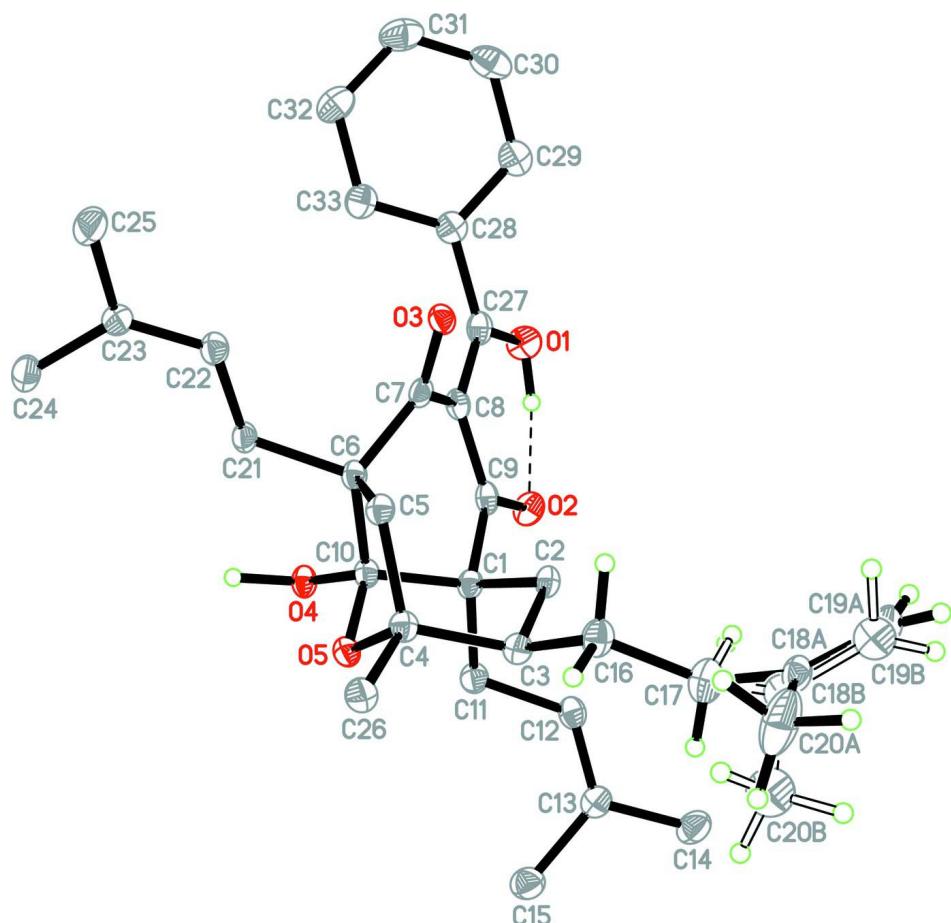

Twigs of *G. propinqua* (1.90 Kg) were successively extracted with acetone over the period of 3 days at room temperature to provide the crude acetone extract (183.72g) which was subjected to quick column chromatography over silica gel and eluted by gradients of EtOAc-hexanes (100% hexanes to 100% EtOAc) to yield fourteen fractions (A-N). Fraction B (268.0 mg) was subjected to sephadex LH-20 using CH<sub>3</sub>OH as eluent to afford compound (I) (21.8 mg) as white solid. Colorless plate-shaped single crystals of the title compound suitable for x-ray structure determination were recrystallized from CH<sub>2</sub>Cl<sub>2</sub>:acetone (1:1 v/v) by the slow evaporation of the solvent at room temperature after several days, m.p. 451.0–452.4 K [ $[\alpha]_{D}^{29}$  -21.2 (*c* 0.400, CH<sub>3</sub>OH)].

**S3. Refinement**

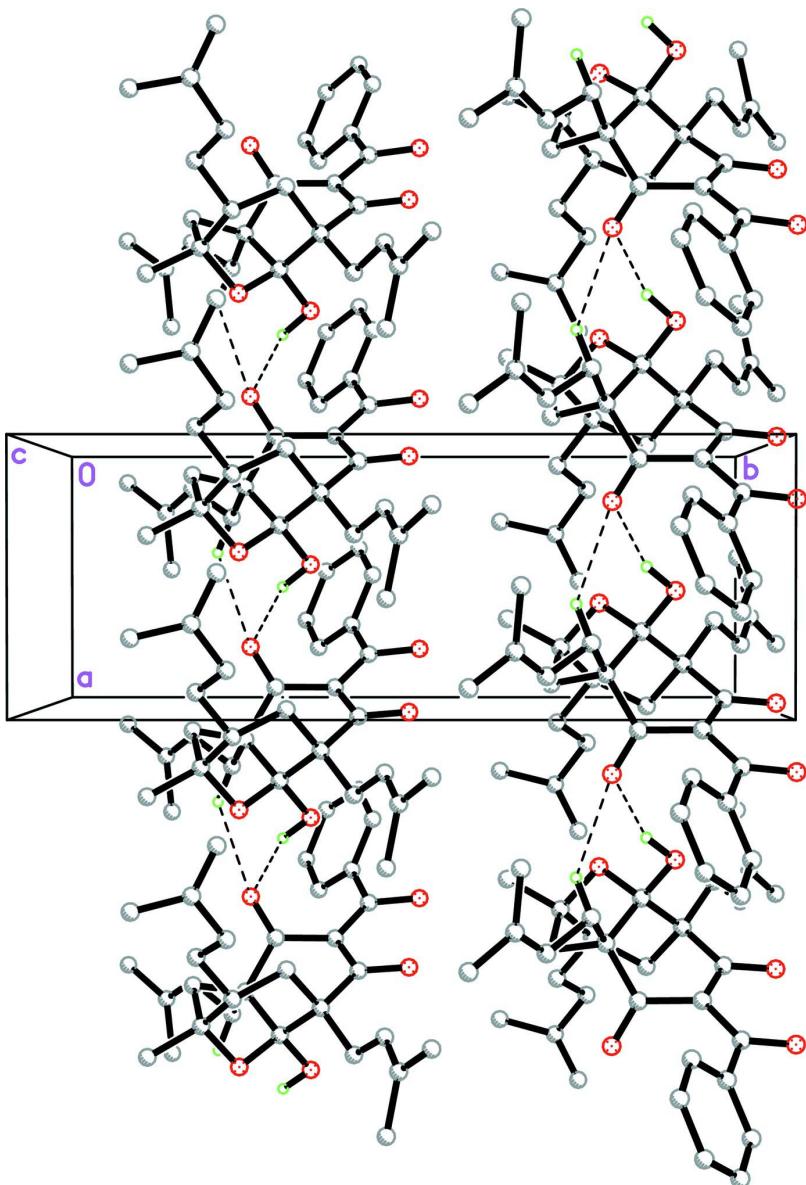

H atoms were placed in calculated positions with d(O—H) = 0.82 Å, and d(C—H) = 0.93 Å for aromatic and CH, 0.97 Å for CH<sub>2</sub> and 0.96 Å for CH<sub>3</sub> atoms. The  $U_{iso}(H)$  values were constrained to be 1.5 $U_{eq}$  of the carrier atom for methyl H atoms and 1.2 $U_{eq}$  for the remaining H atoms. A rotating group model was used for the methyl groups. The 3-methyl-3-butene-1-yl substituent was found to be disordered over two sites in a 0.771 (11): 0.229 (11) occupancy ratio. In the final refinement, distance restraints were used for the disordered components. 2079 Friedel pairs were used to determine the absolute configuration.

**Figure 1**

The molecular structure of the title compound, showing 50% probability displacement ellipsoids and the atom-numbering scheme. Open bond is a minor component. The intramolecular O—H···O hydrogen bond is shown as a dashed line.

**Figure 2**

The molecular structure of the title compound, showing 40% probability displacement ellipsoids and the atom-numbering scheme. The intramolecular O—H···O hydrogen bond was shown as a dashed line. Only H atoms of the hydroxy groups and the disordered side chain substituent are shown for clarity.

**Figure 3**

The crystal packing diagram of the major component of the title compound, viewed along the *c* axis. Only H atoms involving in the hydrogen bonds (dashed lines) are shown.

pairs  
Absolute structure parameter: 0.18 (16)

#### Special details

**Experimental.** The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

*Hydrogen-bond geometry (Å, °)*

Cg4 is the centroid of the C28—C33 ring.

D—H···A	D—H	H···A	D···A	D—H···A
