## Dimethyl 5,5'-methylenebis(2-hydroxybenzoate)

Samuel Guieu, ${ }^{\text {a* }}$ Paula Brandão, ${ }^{\text {b }}$ João Rocha ${ }^{\text {b }}$ and Artur M. S. Silva ${ }^{\text {a }}$<br>${ }^{\text {a }}$ University of Aveiro, QOPNA, Department of Chemistry, 3810-193 Aveiro, Portugal, and ${ }^{\text {b }}$ University of Aveiro, CICECO, Department of Chemistry, 3810-193 Aveiro, Portugal<br>Correspondence e-mail: sguieu@ua.pt

Received 27 March 2012; accepted 11 April 2012
Key indicators: single-crystal X-ray study; $T=150 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.040 ; w R$ factor $=0.113$; data-to-parameter ratio $=16.1$.

In the title compound, $\mathrm{C}_{17} \mathrm{H}_{16} \mathrm{O}_{6}$, the two methyl salicylate moieties are related by crystallographic twofold rotational symmetry with the two benzene rings close to being perpendicular [inter-ring dihedral angle $=86.6(8)^{\circ}$ ]. Intramolecular phenolic $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds with carboxyl O -atom acceptors are present, with these groups also involved in centrosymmetric cyclic intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen-bonding associations [graph set $R_{2}^{2}(4)$ ], giving infinite chains extending across (101).

## Dimethyl 5,5'-methylenebis(2-hydroxybenzoate)

Samuel Guieu, Paula Brandão, João Rocha and Artur M. S. Silva

## S1. Comment

The title compound $\mathrm{C}_{17} \mathrm{H}_{16} \mathrm{O}_{6}$ was first reported as a building block for polymer synthesis (Ogata et al., 1975). It is a useful precursor for organic polymers, metal-organic frameworks, cage compounds (Méric et al., 1993) and biologically active compounds (Shrestha et al., 2007; Cameron et al., 2002). In the title compound (Fig. 1), the two methyl salicylate moieties are related by crystallographic twofold rotational symmetry with the two phenyl rings close to perpendicular [inter-ring dihedral angle $=86.6(8)^{\circ}$ ]. Bond lengths and angles are within normal ranges (Allen et al., 1987). Intramolecular phenolic $\mathrm{O}-\mathrm{H}^{\cdots} \mathrm{O}$ hydrogen bonds with carboxyl O -atom acceptors are present, with these groups also involved in centrosymmetric cyclic intermolecular hydrogen-bonding associations [graph set $R^{2}{ }_{2}(4)$ (Etter et al., 1990)], making the ester group essentially coplanar with the phenyl ring [torsion angle $\mathrm{C} 1-\mathrm{C} 6-\mathrm{C} 7-\mathrm{O} 3,178.64(9)^{\circ}$ ]. The molecules are involved in centrosymmetric cyclic intermolecular phenolic $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}_{\text {carboxyl }}$ hydrogen-bonding associations [graph set $R^{2}{ }_{2}(4)$ giving infinite chains extending across (101) (Figs. 2, 3).

## S2. Experimental

The title compound was prepared in two steps starting with salicylic acid. 5,5'-Methylenebis(salicylic acid) was prepared according to a known procedure (Cushman et al., 1990), and was then esterified with methanol and a catalytic amount of sulfuric acid (Méric et al., 1993). Slow evaporation of a saturated solution in dichloromethane gave single crystals suitable for X-ray diffraction.

## S3. Refinement

The phenolic H-atom (H1) was located in a difference Fourier map and both positional and isotropic displacement parameters were refined. All other H -atoms were placed in geometrically idealized positions and refined using a riding model with $\mathrm{C}-\mathrm{H}=0.95 \AA$ (aromatic), $0.98 \AA$ (methylene) or $0.97 \AA$ (methyl) and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$ (aromatic or methylene) or $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C})$ (methyl).

Figure 1
The molecular structure of the title compound showing atom numbering and displacement ellipsoids drawn at the $30 \%$ probability level. The intramolecular hydrogen bonds are shown as dashed lines. Symmetry code: (i) $-x+1, y,-z+1 / 2$.

Figure 2
The one-dimensional hydrogen-bonded chains in the title compound, with hydrogen bonds shown as dashed lines. Displacement ellipsoids are drawn at the $30 \%$ probability level.

Figure 3
The packing of the title compound in the unit cell viewed down the $b$ axis, with hydrogen bonds and other intermolecular interactions shown as dashed lines.

> $(\Delta / \sigma)_{\max }=0.049$
> $\Delta \rho_{\max }=0.23$ e $\AA^{-3}$
> $\Delta \rho_{\min }=-0.33$ e $\AA^{-3}$

## Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
