Received 16 May 2012; accepted 20 May 2012

Key indicators: single-crystal X-ray study; $T = 150\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; disorder in main residue; R factor = 0.056; wR factor = 0.125; data-to-parameter ratio = 18.2.

In the title compound, $[\text{Co}(\text{C}_{16}\text{H}_{16}\text{NO}_2)_3]$, the Co^{III} atom is six-coordinated in an irregular octahedral geometry by three N,O -chelating 2-[2-(4-methoxyphenyl)ethyl]iminomethyl-phenolate groups. One of the three methoxy group is disordered over two sets of sites with an occupancy ratio of 0.768 (5):0.232 (5). The crystal packing can be described by alternating zigzag layers of organic ligands and CoN_3O_3 octahedra along the c axis. There are no classical hydrogen bonds in the structure, but $\text{C}-\text{H}\cdots\pi$ interactions occur.

Tris(2-{{[2-(4-methoxyphenyl)ethyl]iminomethyl}phenolato- κ^2N,O^1 })cobalt(III)

Ali Ourari, Yasmina Ouennoughi and Sofiane Bouacida

S1. Comment

The *O*-methyltyramine (4-Methoxyphenyl)ethylamine is an important pharmaceutical product which is metabolized by monoamineoxidases. This compound may be considered a precursor for neurotransmitter in the central nervous system (Van Praag, 1981) and neurohormone in the blood circulation. This amine reacted, in ethanolic solution, with salicylaldehyde to give *N*-Salicylidene(4-methoxyphenylethylamine) as bidentate Schiff base ligand (HL). This ligand, dissolved in absolute ethanol with a cobalt salt leads to the formation of its corresponding cobalt complex (Co(III)-3L). The electrocatalytic performances of this cobalt complex towards the oxidation saturated hydrocarbons or epoxidation of olefins *via* cytochrome P450 model (Yu *et al.*, 2003) by using molecular oxygen is now under progress in our laboratory (Ourari *et al.*, 2008; Ourari *et al.*, 2011). Thus, we report here the synthesis of title compound and its crystal structure. The molecular geometry of (I), and the atomic numbering used, is illustrated in Fig. 1. The Co atom is six coordinated in an irregular octahedral geometry by three (Salicylidene-(4-Methoxyphenyl)ethylamine)groups, while each one is in bidentate chelating coordination with N and O atoms. The bond lengths for co-ordination cobalt sphere is ranging from 1.8791 (17) to 1.9054 (16) Å for Co—O distances and from 1.944 (2) to 1.952 (2) Å for Co—N distances (Table 1). The crystal packing in the title structure can be described by alternating layers in zigzag of organic ligand and CoN_3O_3 octahedral along the *c* axis (Fig. 2). C—H···π interactions consolidate the stabilization (Table 2).

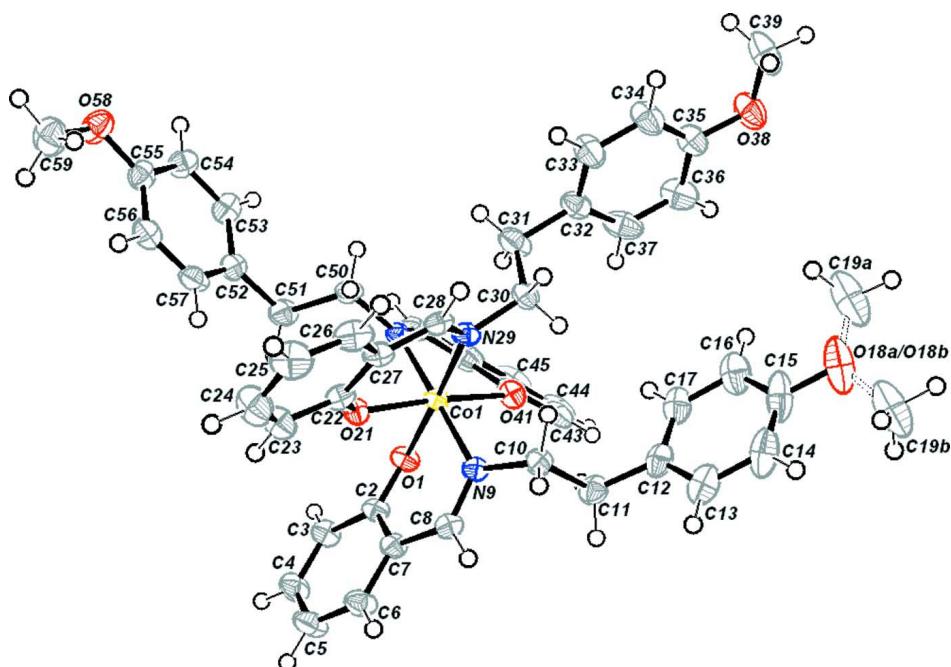

S2. Experimental

151 mg (1 mmol) of (4-methoxyphenyl)ethylamine were dissolved in 8 ml of absolute ethanol and placed in three necked flask surmounted by a condenser. Then, an ethanolic solution of 122 mg (1 mmol) of salicylaldehyde (5 ml) was added drop wise to the previous solution. After addition of the first drops under stirring, the solution turns to the yellow color and then is heated to reflux for 2 h. 238 mg of cobalt chloride hexahydrated ($\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$) were also dissolved in 8 ml of absolute ethanol and added to the ligand solution. This mixture was refluxed again under stirring for 2 other hours to give finally a solid which is recovered by filtration, washed several times with small portions of distilled water. The solid (crystals) was dried in vaccuo in presence of CaCl_2 to yield 168 mg (61%).

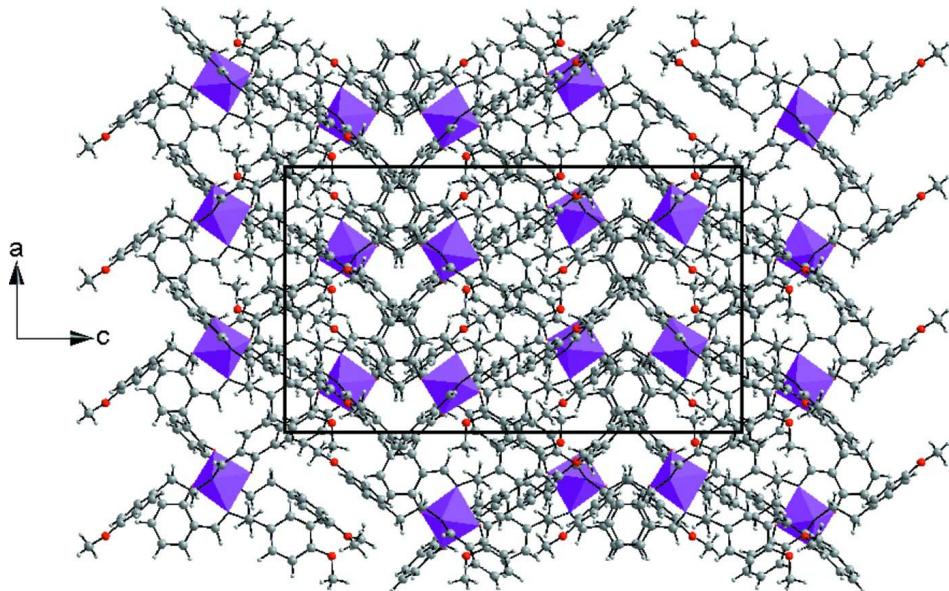

S3. Refinement

H atoms were localized on Fourier maps but introduced in calculated positions and treated as riding on their parent atoms (C) with $\text{C}—\text{H} = 0.98$ Å (methyl), 0.99 Å (methylene) and 0.95 Å (aromatic) with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}_{\text{aromatic}}, \text{C}_{\text{methylene}}$ and $\text{C}_{\text{methyl}})$ and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$.

One of three methoxy group is disordered in two sites with carbon atoms C19A and C19B (77/23).

**Figure 1**

 $\Delta\rho_{\max} = 1.10$ e Å⁻³
 $\Delta\rho_{\min} = -0.30$ e Å⁻³

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg1 and Cg2 are the centroids of the C52—C57 and C42—C47 rings, respectively.

D—H···A	D—H	H···A	D···A	D—H···A
