Received 25 March 2012; accepted 23 May 2012

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; some non-H atoms missing; R factor = 0.052; wR factor = 0.134; data-to-parameter ratio = 15.2.

The title compound, $\text{C}_{15}\text{H}_{17}\text{O}_6\text{P}$, was obtained from a reaction of 4-methyl-7-hydroxycoumarin and 2-chloro-5,5-dimethyl-1,3,2-dioxaphosphinan 2-oxide. There are two molecules in the asymmetric unit in which the benzopyran ring system is almost planar [r.m.s. deviation for each molecule = 0.003 Å]. In the crystal, $\text{C}-\text{H} \cdots \text{O}$ hydrogen bonds and $\pi-\pi$ stacking interactions [with centroid–centroid distances of 3.743 (3) and 3.727 (3) Å] link the two molecules. The dioxaphosphorinan ring adopts a chair conformation in both asymmetric molecules.

7-[(5,5-Dimethyl-2-oxido-1,3,2-dioxaphosphinan-2-yl)oxy]-4-methyl-2*H*-chromen-2-one

Yan-Ru Zhao, Xu-Feng Hou and Zhi-Hong Xu

S1. Comment

2-oxido-1,3,2-dioxaphosphinan and its derivatives exhibit high flame-retardance (Li *et al.*, 2002; Li *et al.*, 2006) as well as biological and pharmaceutical activity (Babu *et al.*, 2008). Coumarin and its derivatives have a wide range of biological activities, and for years have received significant attention regarding natural and synthetic sources (Siersławski *et al.*, 2006; Zhou *et al.*, 2006). Few crystal structures containing both of these groups have been characterized. We report here the crystal structure of a new 2-chloro-1,3,2-dioxaphosphinan derivative containing the 7-oxy-4-methyl-2*H*-chromen-2-one group.

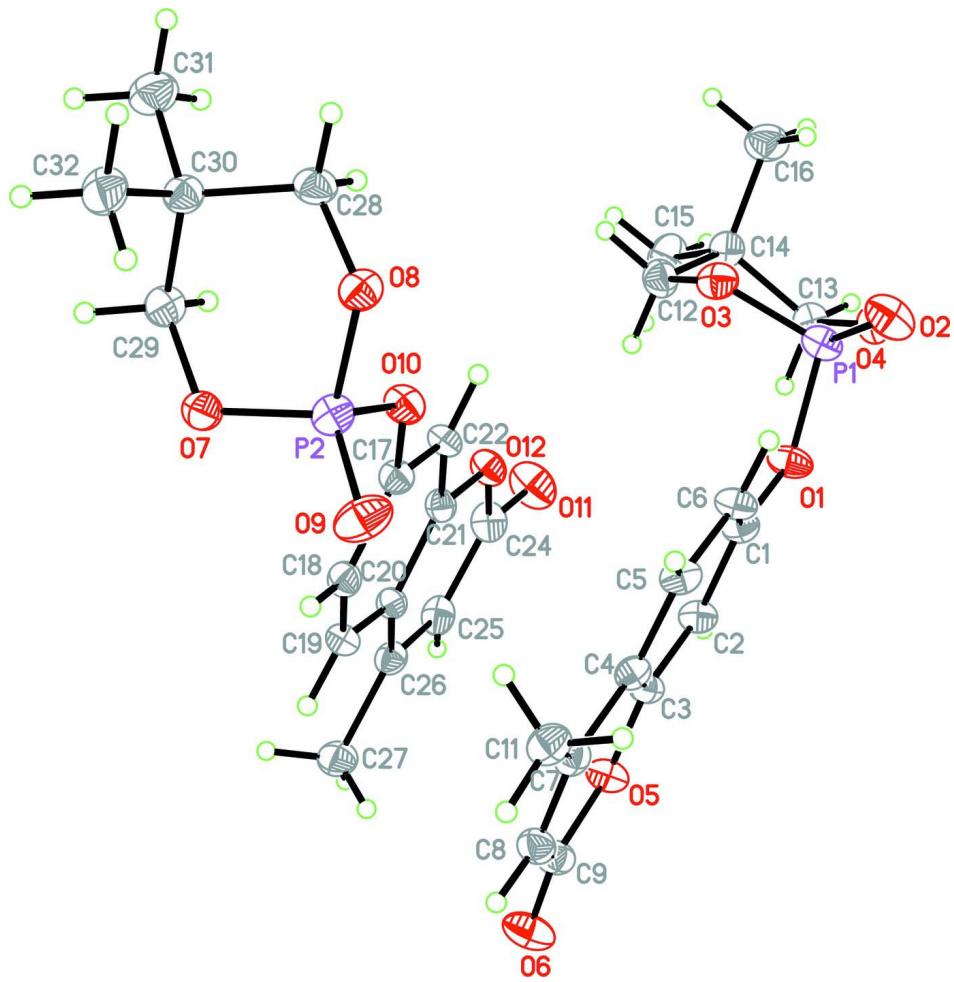

In the title compound, C₁₅H₁₇O₆P, bond distances and angles in (I) are as expected, and the dioxaphosphinan ring adopts a chair conformation (Fig. 1). π-π stacking interactions and C—H···O hydrogen bonds link the molecules. (Table 1, Fig. 2)

S2. Experimental

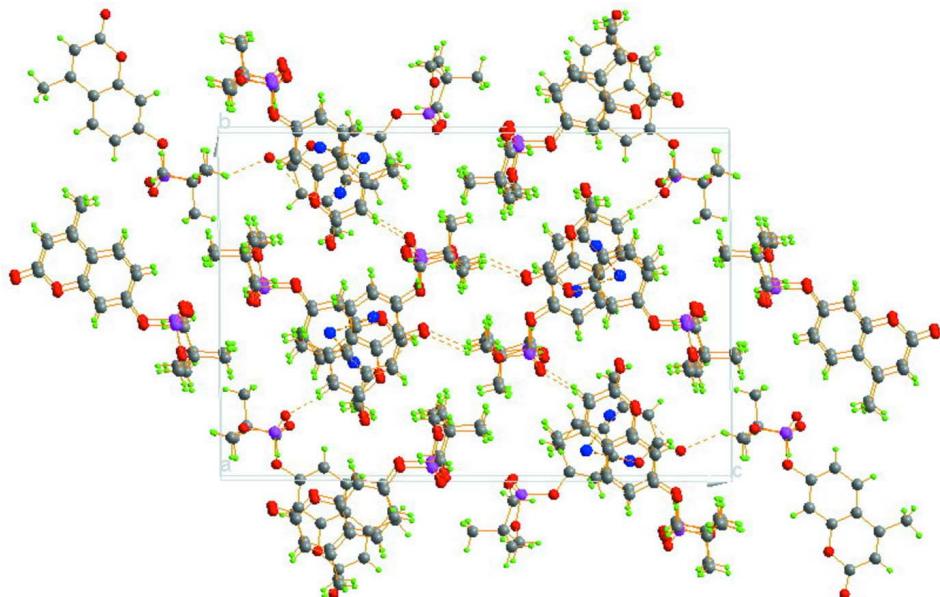

The title compound was prepared according to the procedure of Raghu & Reddy (1996). The 4-methyl-7-hydroxy-coumarin (0.95 g, 6.2 mmol), dry dichloromethane (10 ml) and triethylamine (0.61 g, 6 mmol) were placed in a 100 ml three-necked flask and a solution of 2-chloro-5,5-dimethyl-[1,3,2]dioxaphosphinan 2-oxide (1.12 g, 6.1 mmol) in dry dichloromethane (5 ml) was added dropwise over a period of 1 h at room temperature (298 K). The reaction temperature was raised to 308 K and stirring was continued for 8 h. The solvent was removed under reduced pressure and the residual mixture was washed with anhydrous ether (25 ml), dried and recrystallized from ethanol to give compound (I). Suitable crystals were obtained from anhydrous methanol at room temperature (m.p. 440 K).

S3. Refinement

All H atoms were placed in calculated positions, with C—H = 0.98 Å or 0.99 Å, and included in the final cycles of refinement using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

**Figure 1**

The asymmetric unit of the title compound, (I), with displacement ellipsoids drawn at the 30% probability level.

**Figure 2**

The partial packing diagram of the title compound, hydrogen bonds and π - π interactions are indicated by dashed lines, with centroids indicated in blue.

 Extinction coefficient: 0.0028 (4)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
