Received 11 May 2012; accepted 24 May 2012

Key indicators: single-crystal X-ray study;  $T = 113$  K; mean  $\sigma(\text{C}-\text{C}) = 0.006$  Å;  $R$  factor = 0.062;  $wR$  factor = 0.131; data-to-parameter ratio = 12.1.

In the dinuclear title compound,  $[\text{Na}_2(\text{C}_{13}\text{H}_{15}\text{ClN}_5\text{O}_5\text{S})_2(\text{H}_2\text{O})_6]_n$ , two  $\text{Na}^+$  cations, disposed about a centre of inversion, are linked by two bridging water molecules. The coordination geometry is based on an  $\text{O}_5$  donor set defined by four water molecules and a 4-aminobenzenesulfonate O atom in a distorted trigonal-bipyramidal geometry. In the crystal, significant  $\text{O}-\text{H}\cdots\text{O}$ ,  $\text{O}-\text{H}\cdots\text{N}$  and  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds lead to the formation of a three-dimensional architecture.

### **S1. Comment**

Cyanuric chloride derivatives are widely used in commercial chemicals, especially in pesticides, reactive dyes, fluorescent brighteners, liposome and polymer photostabilizers (Hollink *et al.*, 2005; Candiani & Frigerio, 2007). The widespread use of these compounds is due to their higher reactive activity (Konstantion & Petrova, 2002). The title compound belongs to the cyanuric chloride derivatives and its structure is reported herein.

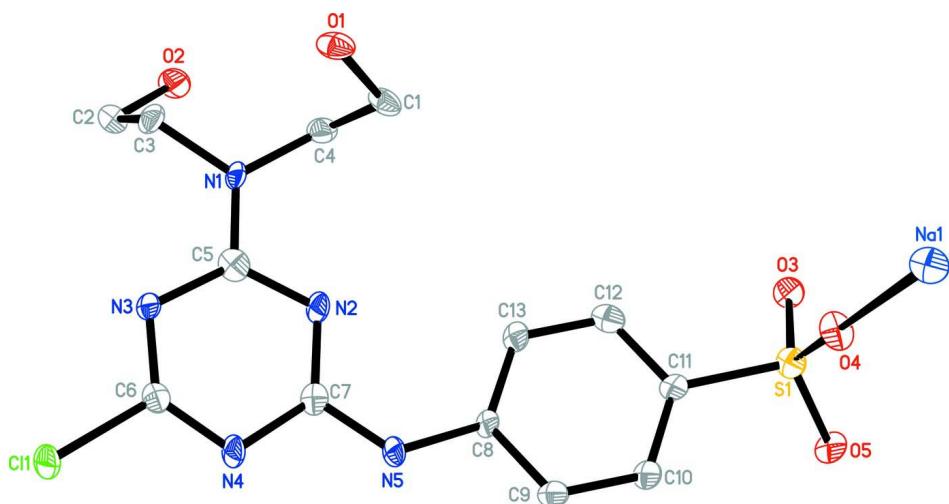

The asymmetric unit is shown in Fig. 1. The dihedral angle between the benzene ring and the triazine ring is 8.6 (2)°. As shown in Fig. 2, the crystal packing displays O—H···O, O—H···N and N—H···O hydrogen bonds, Table 1.

### **S2. Experimental**

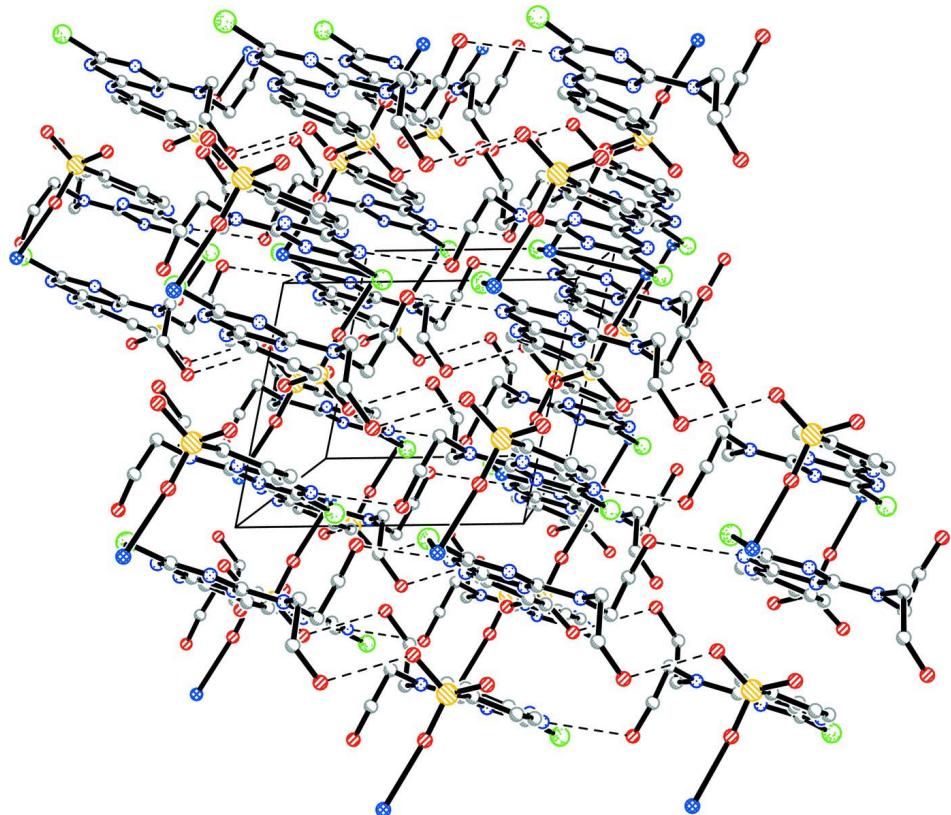

Cyanuric chloride (0.1 mol) was dissolved in acetone (120 ml). This solution was poured into distilled water (150 ml) with crushed ice (150 g). The reaction system was stirred maintaining the temperature at 0–5 °C in the ice-bath. An aqueous solution of sodium sulfate (0.1 mol) was slowly dropped into the above reaction vessel within 0.5 h, and then a 20% aqueous solution of sodium carbonate was added drop-wise to the reaction mixture to keep the pH at 7–8. Then the mixture was kept stirring for 5 h at 0–5 °C. After the reaction was completed, the white precipitate was filtered, washed with acetone and water twice, respectively, and dried at room temperature under vacuum to constant weight. This white powder is intermediate I. The intermediate I (0.05 mol) and a mixed solution of water and acetone (160 ml) were added into 250 ml four-neck flask. After stirring for 0.5 h at 25 °C, an aqueous solution of diethanol amine (0.06 mol) was slowly dropped into the reaction vessel within 0.5 h, and then a 20% aqueous solution of sodium carbonate was added drop-wise to the reaction mixture to keep the pH at 8–9. Then the mixture was kept stirring for 6 h at 45 °C. After the reaction was completed, the solution was rotary evaporated, washed with anhydrous alcohol twice, and dried at room temperature under vacuum to constant weight. The target product was obtained. Crystals of the title compound were obtained by slow evaporation of its methanol/n-hexane solution held at room temperature.

### **S3. Refinement**

Carbon-bound H-atoms were placed in calculated positions [C—H = 0.95 to 0.99 Å,  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ ] and were included in the refinement in the riding model approximation. The positions of the O- and N- bound H-atoms were refined with light distance restraints, and with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{water-O,N})$  and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{hydroxyl-O})$ ].

**Figure 1**

The molecular structure of (I). Displacement ellipsoids are drawn at the 30% probability level. H atoms have been omitted.

**Figure 2**

A view of the crystal packing for (I). Hydrogen bonds are shown as dashed lines.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
