## 4-Chloroanilinium thiocyanate

Siti Fairus M. Yusoff, F. Salem Halima and Bohari M. Yamin*

School of Chemical Sciences and Food Technology, Universiti Kebangsaan Malaysia, 43600 Bangi, Selangor, Malaysia
Correspondence e-mail: bohari@pkrisc.cc.ukm.my
Received 23 May 2012; accepted 24 May 2012
Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.039 ; w R$ factor $=0.108$; data-to-parameter ratio $=16.5$.

In the title compound, $\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{ClN}^{+} \cdot \mathrm{NCS}^{-}$, the benzene ring and the protonated amine and chloro substituents are nearly planar, with a maximum deviation of 0.002 (2) $\AA$ for the N atom. In the crystal, the molecules are linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{S}$ hydrogen bonds into a chain along the $b$ axis.

## 4-Chloroanilinium thiocyanate

Siti Fairus M. Yusoff, F. Salem Halima and Bohari M. Yamin

## S1. Comment

The title compound (Fig. 1) is an organic thiocyanate similar to dicylohexylammonium thiocyanate (Khawar Rauf et al., 2008; Selvakumaran et al., 2011) and recently 2-cyclohexan-1-iminium thiocyanate (Salem et al., 2012). The paraanilinium cation is planar except the hydrogen atoms of the ammonium moiety. The maximum deviation is 0.002 (2) $\AA$ for N1 atom from the least square plane. The thiocyanate ion is linear with N2-C7-S1 bond angle of $179.5(2)^{\circ}$. The bond lengths and angles are in normal range (Allen et al., 1987; 2002). In the crystal structure, the molecules are linked by the intermolecular hydrogen bonds between the hydrogen atoms of the ammonium moiety with the nitrogen and sulfur atoms of the thiocynato anion (Table 1) to form one-dimensional chain along the $b$ axis (Fig. 2).

## S2. Experimental

All solvents and chemicals were of analytical grade and were used without purification. The title compound was prepared by mixing ammonium thiocyanate $(0.76 \mathrm{~g}, 0.01 \mathrm{~mol})$ and para-chloroaniline $(1.27 \mathrm{~g}, 0.01 \mathrm{~mol})$ in the presence of HCl . The mixture was refluxed for 1 h . Single crystals were obtained from the solution after one day of evaporation. Yield 85\%; m.p: 390.5-393.2 K.

## S3. Refinement

After their location in the difference map, the H -atoms attached to the C were fixed geometrically at ideal positions and allowed to ride on the parent atoms with $\mathrm{C}-\mathrm{H}=0.93 \AA$, with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C}$,$) However, the protonated amino$ hydrogen atoms were located from the Fourier map and refined isotropically.

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.039$
$w R\left(F^{2}\right)=0.108$
$S=1.18$
$F(000)=768$
$D_{\mathrm{x}}=1.394 \mathrm{Mg} \mathrm{m}^{-3}$
Mo $K \alpha$ radiation, $\lambda=0.71073 \AA$
Cell parameters from 4443 reflections
$\theta=1.2-26.5^{\circ}$
$\mu=0.60 \mathrm{~mm}^{-1}$
$T=298 \mathrm{~K}$
Slab, colourless
$0.50 \times 0.43 \times 0.30 \mathrm{~mm}$

10422 measured reflections
1846 independent reflections
1628 reflections with $I>2 \sigma(I)$
$R_{\text {int }}=0.024$
$\theta_{\text {max }}=26.5^{\circ}, \theta_{\text {min }}=1.2^{\circ}$
$h=-5 \rightarrow 9$
$k=-9 \rightarrow 8$
$l=-38 \rightarrow 40$

## 1846 reflections

112 parameters
3 restraints
Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement

```
\(w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.0501 P)^{2}+0.6879 P\right]\)
    where \(P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3\)
\((\Delta / \sigma)_{\max }<0.002\)
\(\Delta \rho_{\text {max }}=0.31 \mathrm{e} \AA^{-3}\)
\(\Delta \rho_{\text {min }}=-0.19 \mathrm{e}^{-3}\)
```

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
