Correspondence e-mail: xlms2003@163.com

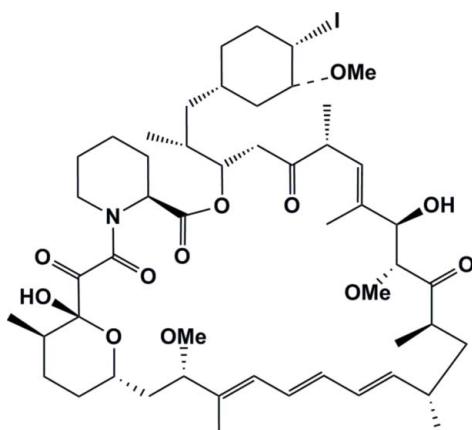

Received 2 April 2012; accepted 18 June 2012

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.008\text{ \AA}$; R factor = 0.049; wR factor = 0.136; data-to-parameter ratio = 14.5.

The title compound, $C_{51}H_{78}INO_{12}$, contains a 29-membered ring incorporating amide, lactone and ester groups. It contains a total of 15 stereogenic centres. In the crystal, molecules are linked by $O-\text{H}\cdots O$ hydrogen bonds, forming $C(8)$ chains propagating in [100]. A weak intramolecular $O-\text{H}\cdots O$ interaction also occurs.

40-Deoxy-40(S)-iodorapamycin

Lijun Xie, Jian Zuo, Guoxin Yang, Congshen Zheng and Yuanrong Cheng

S1. Comment

Sirolimus is a macrocyclic natural product (also known as rapamycin), has been originally developed as an antifungal agent. However, this application was abandoned when rapamycin became a potent immunosuppressive agent which is used clinically to prevent rejection of transplanted organs (Calne *et al.*, 1989). Recently, there are also many reports about potent anticancer activities of rapamycin derivatives, such as AP-23573, CCI-779 and RAD-001; they are promising agents for treating certain cancers (Chan *et al.*, 2004; Sun *et al.*, 2005). Herein, we present the synthesis and structure of a rapamycin derivative, [40-Deoxy-40(S)-iodo]-rapamycin.

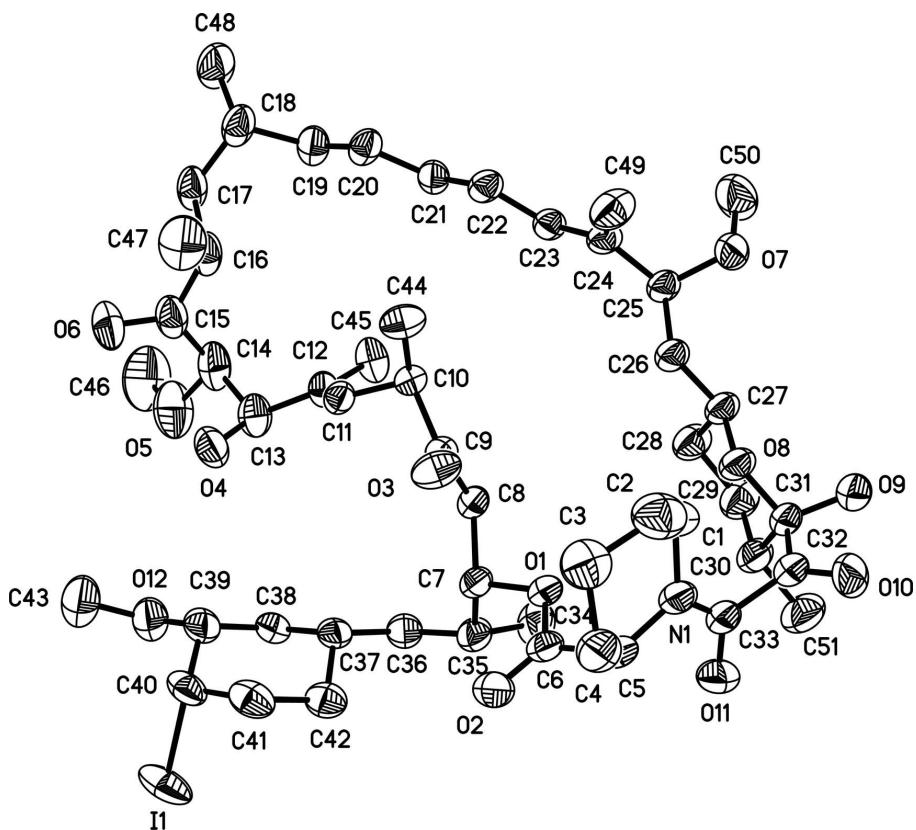

The crystal structure of the title compound is given in Fig. 1. The title compound has macrocyclic structure which contains an amide C33—N1, a lactone C6—O1, an oxygen bridge between C27 and C31 and an additional bond between N1 and C5 to form a piperidine unit. In the crystal, the adjacent molecules are stabilized by classical intermolecular O—H···O hydrogen bonding, with the distance of 2.937 (5) Å (Table 1).

S2. Experimental

Trifluoromethanesulfonic anhydride (21.4 mmol, 3.6 ml) was added gradually to the mixture solution of rapamycin (11.0 mmol, 10 g) and 2,6-Lutidine (65.0 mmol, 7.6 ml) in dry dichloromethane (60 ml). The reaction mixture was stirred at 273 K for 1 h, then the mixture was quenched with a saturated NaHCO₃ solution (100 ml) and diluted with dichloromethane. The organic phase was evaporated under reduced pressure to get the crude mixture which dissolved in the mixture of acetone and purified water (50/1), the sodium iodide (55.0 mmol, 9.1 g) was added to the reaction mixture. The reaction mixture was stirred at room temperature for 6 h. The mixture was concentrated under reduced pressure. The crude mixture was purified by flash column chromatography (silica, 1%–10% EtOAc/hexanes) to furnish the product. Colorless blocks of the title compound were obtained in ether solution after 10 day by slow evaporation at room temperature.

S3. Refinement

All H-atoms were positioned geometrically and refined using a riding model, with C—H = 0.96 Å (CH₃), 0.97 Å (CH₂), 0.98 Å (CH), and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
