Received 29 August 2012; accepted 5 September 2012

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.044; wR factor = 0.132; data-to-parameter ratio = 13.5.

In the title compound, $\text{C}_{38}\text{H}_{31}\text{ClN}_2\text{O}_4$, the isoxazole ring adopts an envelope conformation with the N atom as the flap. The crystal packing is stabilized by $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds, forming chains running along the c -axis direction.

S1. Comment

The role of β -lactam antibiotics is well known (Banik & Becker, 2000). The most commonly used β -lactam antibiotics for the therapy of infectious diseases are penicillin and cephalosporin (Brakhage, 1998). β -Lactam based antibiotics have been successfully used in the treatment of infectious diseases for many years (Jones *et al.*, 1989). In view of potential applications, the crystal structure determination of the titled β -lactam derivative was carried out.

In the title compound (Fig. 1), the β -lactam ring makes a dihedral angle of 10.33 (14) $^\circ$ with a isoxazole ring (N2/O3/C17/C18/C19), a dihedral angle of 40.33 (14) $^\circ$ with the methoxy phenyl ring and a dihedral angle of 70.05 (16) $^\circ$ with the unsubstituted phenyl ring. The dihedral angle between the isoxazole ring and the unsubstituted phenyl ring (C20/C21/C22/C23/C24/C25) is 81.42 (12) $^\circ$, which shows that they are almost orthogonal to each other. The dihedral angle between the isoxazole ring and the unsubstituted phenyl ring (C11/C12/C13/C14/C15/C16) is 80.38 (14) $^\circ$, which shows that they are also almost orthogonal to each other. The isoxazole ring makes a dihedral angle of 40.35 (12) $^\circ$ with the chlorophenyl ring.

The oxygen atom attached to the β -lactam ring deviates by -0.1871 (18) \AA . The oxygen atom attached to the phenyl ring deviates by 0.0237 (21) \AA . The packing of the crystal structure is stabilized by intermolecular C—H \cdots O hydrogen bonds (Fig. 2). A related structure was published by Sundaramoorthy *et al.* (2012).

S2. Experimental

To a solution of the N-benzylideneaniline oxide (1 mol) in dry acetonitrile (20 ml) was added (E)-4-(3-(4-chlorophenyl)-3-oxoprop-1-enyl)-1-(4-methoxyphenyl)-3-phenylazetidin-2-one (1 mol) under N_2 atmosphere. The reaction was refluxed for 48 hours. After the completion of the reaction the solvent was distilled off under reduced pressure and the crude product was purified by column chromatography using 9:1 mixture of hexane-ethyl acetate. Crystallization of the pure compound was done using 1:1 mixture of chloroform-ethyl acetate.

S3. Refinement

The hydrogen atoms were placed in calculated positions with C—H = 0.93 \AA to 0.98 \AA and refined using a riding model with fixed isotropic displacement parameters: $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for the methyl group and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for the remaining H atoms.

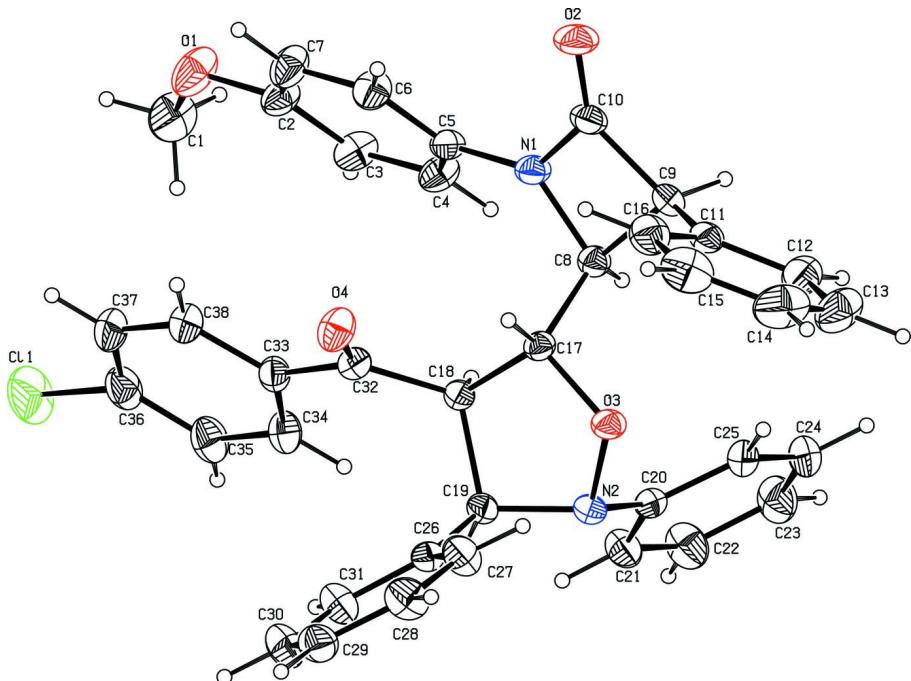

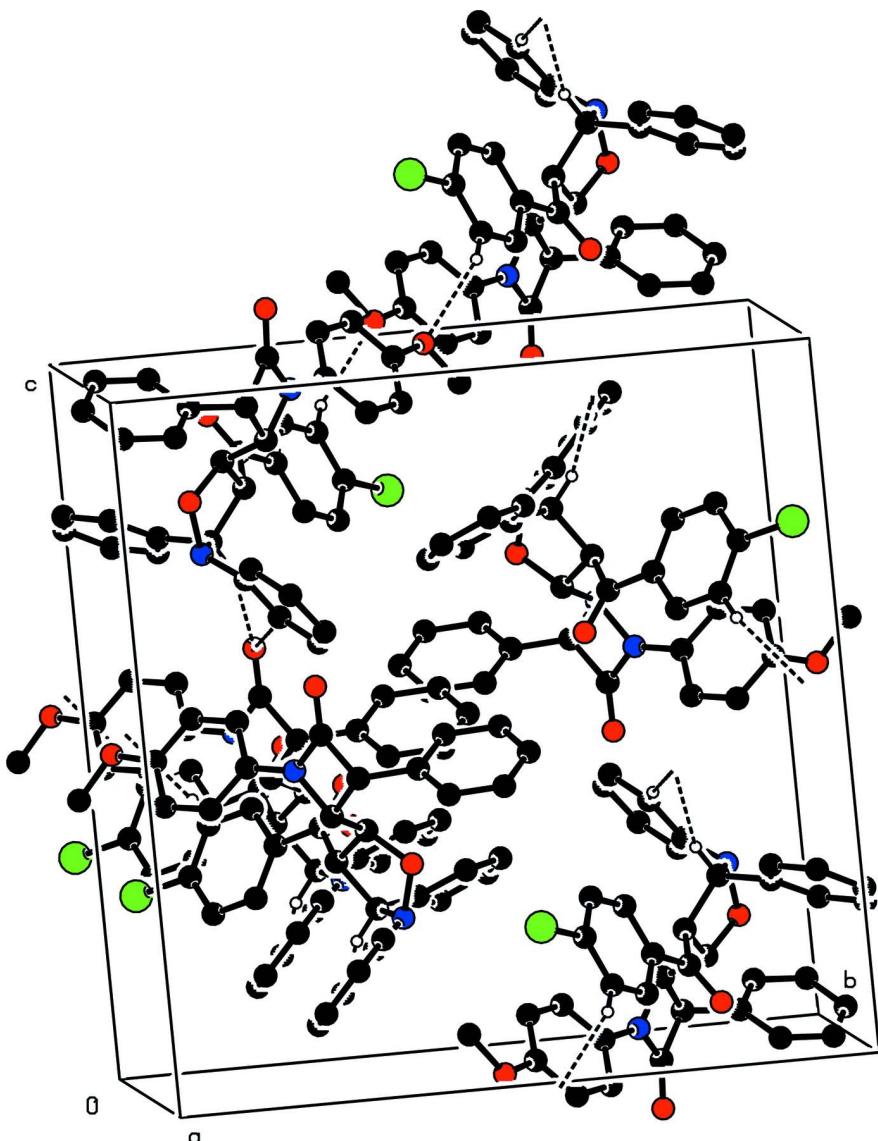

Figure 1

The molecular structure of the title compound, showing displacement ellipsoids drawn at the 30% probability level. H atoms are presented as small spheres of arbitrary radius.

**Figure 2**

The crystal packing of the title compound viewed down the *c* axis. H-atoms not involved in H-bonds have been excluded for clarity.

 $\Delta\rho_{\min} = -0.41 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
