Received 17 July 2012; accepted 6 September 2012

Key indicators: single-crystal X-ray study; $T = 180$ K; mean $\sigma(C-C) = 0.004$ Å; some non-H atoms missing; R factor = 0.045; wR factor = 0.122; data-to-parameter ratio = 14.9.

In the title compound, $[K(C_{18}H_{36}N_2O_6)][Co(NCO)_2(C_{44}H_{28}N_4)] \cdot 0.5C_6H_5Cl$ or $[K(2,2,2-crypt)^+][Co^{III}(NCO)_2(TPP)^-] \cdot 0.5C_6H_5Cl$, the Co^{III} ion is octahedrally coordinated by two axial N-bonded NCO^- anions and four pyrrole N atoms of the porphyrin. There is a major ruffling distortion of the porphyrin: the dihedral angles between *trans* pyrrole rings are 34.32 (14) and 34.72 (14)°. The potassium ion is coordinated by the six O atoms and two N atoms of the cryptand-222 molecule and a weak $K-O$ [3.407 (3) Å] bond to one of the cyanate O atoms also occurs. The packing also features weak C—H···O and C—H···π interactions. The contribution to the scattering of the disordered chlorobenzene solvent molecules was removed with the SQUEEZE function in PLATON [Spek (2009). *Acta Cryst. D65*, 148–155].

(2,2,2-Cryptand)potassium bis(cyanato- κN)(5,10,15,20-tetraphenylporphyrinato- $\kappa^4 N$)cobaltate(III) chlorobenzene hemisolvate

Bader Belhaj Ali, Mohamed Salah Belkhiria, Jean-Claude Daran and Habib Nasri

S1. Comment

Iron and cobalt porphyrin complexes have been used for many decades as biomimetic models for hemoproteins. These species are actually used in a variety of others domains (*i.e.*; catalysis, bio-sensors). Several iron and cobalt metalloporphyrins have been synthesized and characterized by our group (Dhifet *et al.*, 2010; Mansour *et al.*, 2010).

We report herein on the molecular structure of the title compound for which the asymmetric unit contains one ion complex $[\text{Co}^{\text{III}}(\text{TPP})(\text{NCO})_2]$, the $[\text{K}(2,2,2\text{-crypt})]^+$ counterion and one half chlorobenzene solvent. For (I), the cobalt is coordinated to the four N atoms of the porphyrin ring and the N atoms from the two NCO^- *trans* axial ligands (Fig. 1). The two axial Co—N(NCO) bond lengths for (I) [1.905 (2) and 1.919 (2) Å] are in the range [1.898 (6) - 1.936 (7) Å] found for six-coordinated Co(III) complexes (CSD refcodes IFUVOU; Englert *et al.*, 2002 and KEYMEC; Bresciani-Pahor *et al.*, 1990) (CSD, version 5.32; Allen, 2002).

As seen in figure 1, the oxygen atom O2 of one cyanato-*N* axial ligand is weakly bonded to the potassium of the counterion $[\text{K}(2,2,2\text{-crypt})]^+$ with a distance of 3.407 (3) Å. The average K—O(2,2,2-crypt) distance is 2.831 (2) Å and the average K—N(2,2,2-crypt) bond length is 3.016 (2) Å. The porphyrin core is far from being planar, with deviations of atoms from the least-squares plane of $\text{CoN}_4\text{C}_{20}$, ranging from -0.586 (2) to 0.607 (2) Å. It is noteworthy the relationship between the ruffling of the porphyrin core and the mean equatorial Co—N_p distance; the $\text{CoN}_4\text{C}_{20}$ moiety is ruffled as the Co—N_p distance decreases, (Timuna *et al.*, 1988). Thus, the practically planar porphyrin core of the ion complex $[\text{Co}(\text{OEP})(\text{NO}_2)_2]$ (OEP is the octaethylporphyrin) (Ali *et al.*, 2011) presents a Co—N_p of 1.988 (2) Å while for the very ruffled structure $[\text{Co}^{\text{II}}(\text{TPP})]$ (Konarev *et al.*, 2003) the Co—N_p bond length value is 1.923 (4) Å. Therefore, the Co—N_p distance of (I) [1.950 (2) Å] is normal for a cobalt ruffled TPP complex. On the other hand Normal Structural Decomposition (NSD) calculations (Jentzen, *et al.*, 1997) confirm the unusually important deformation of the porphyrin core with a major ruffling distortions of 78%.

The crystal packing features weak C—H···π interactions (Table 1 and Fig. 2)

S2. Experimental

The reaction of the $[\text{Co}^{\text{II}}(\text{TPP})]$ complex (Madure & Scheidt, 1976) (15 mg, 0.022 mmol) with an excess of potassium cyanate KOCN (50 mg, 0.62 mmol) and cryptand-222 (50 mg, 0.13 mmol) in chlorobenzene (4 ml) under air overnight give a red-brown solution. Dark purple prisms of the title complex were obtained by diffusion of hexanes through the chlorobenzene solution.

S3. Refinement

Hydrogen atoms were placed using assumed geometrically idealized positions (C—H aromatic = 0.95 Å) and constrained to ride on their parent atoms, with $U(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$.

There are four cavities of 224 \AA^3 each. *PLATON* estimated that each cavity contains 33 electrons which may correspond to a half solvent molecule of chlorobenzene by asymmetric unit as suggested by chemical analyses. These residual electron density was difficult to modelize and therefore, the SQUEEZE function of *PLATON* (Spek, 2009) was used to eliminate the contribution of the electron density in the solvent region from the intensity data, and the solvent-free model was employed for the final refinement.

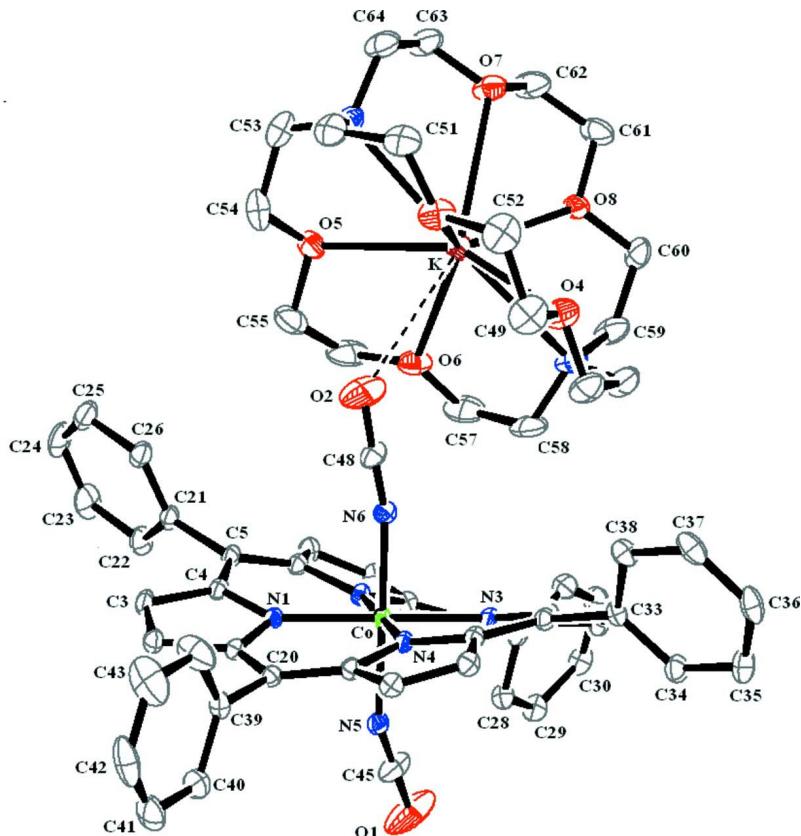

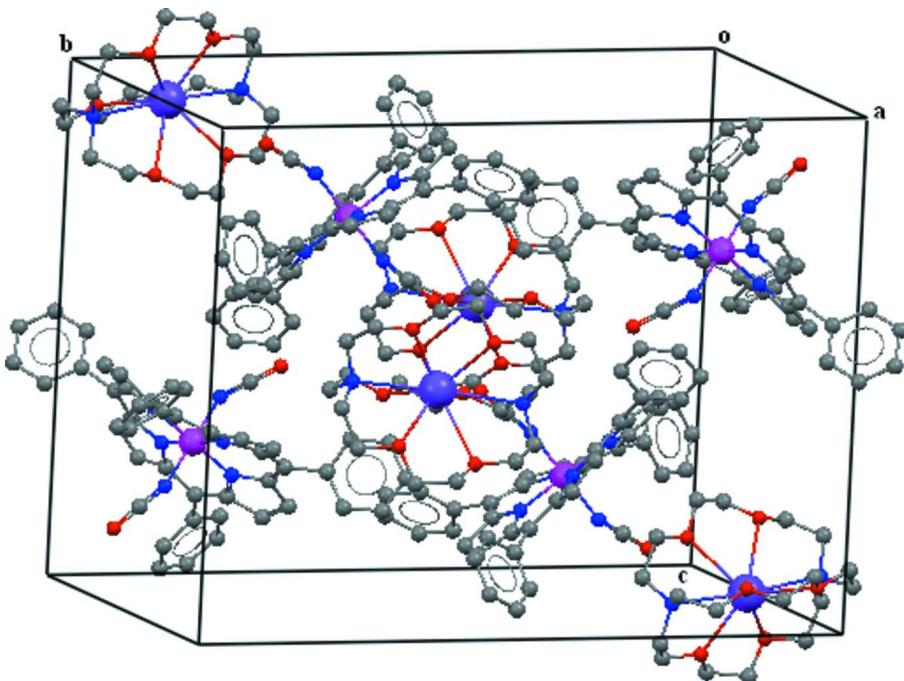

Figure 1

A view of the structure of (I). Displacement ellipsoids are drawn at 50% and H atoms have been omitted for clarity.

**Figure 2**

A unit-cell packing of (I). The H atoms have been omitted for clarity.

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of $F^{\wedge}2\wedge$ against ALL reflections. The weighted R -factor wR and goodness of fit S are based on $F^{\wedge}2\wedge$, conventional R -factors R are based on F , with F set to zero for negative $F^{\wedge}2\wedge$. The threshold expression of $F^{\wedge}2\wedge > \sigma(F^{\wedge}2\wedge)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on $F^{\wedge}2\wedge$ are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg2 and Cg4 are the centroids of the N2/C6—C9 and N4/C16—C19 rings, respectively.

D—H···A	D—H	H···A	D···A	D—H···A
C50—H50A···O2 ⁱ	0.97	2.59	3.555 (4)	171
C57—H57B···Cg2	0.97	2.83	3.783 (4)	168
C60—H60B···Cg4 ⁱⁱ	0.97	2.60	3.437 (3)	145

Symmetry codes: (i) $-x+1, -y+1, -z+1$; (ii) $x-3/2, -y-1/2, z-3/2$.
