Received 11 October 2012; accepted 24 October 2012

Key indicators: single-crystal X-ray study; $T = 150$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; disorder in main residue; R factor = 0.027; wR factor = 0.072; data-to-parameter ratio = 19.8.

The title dimeric zirconium complex, $[\text{Zr}_2(\text{C}_{20}\text{H}_{24})_2\text{S}_2] \cdot \text{C}_7\text{H}_8$, was obtained from the reaction of (ebthi) $\text{Zr}(\eta^2\text{-Me}_3\text{Si-C}_2\text{-SiMe}_3)$ [ebthi is *rac*-1,2-bis(η^5 -4,5,6,7-tetrahydroinden-1-yl)ethane] and $\text{S}=\text{C}=\text{N}$ -ada (ada = adamantan-1-yl) along with the formation of the isonitrile $\text{C}\equiv\text{N}$ -ada. Each Zr^{IV} atom is coordinated by the sterically hindered ebthi ligand and two μ -sulfide ligands in a strongly distorted tetrahedral geometry. The $[\text{ZrS}]_2$ unit is almost planar (mean deviation from the best plane of the four atoms = 0.025 Å). A $-\text{CH}_2-\text{CH}_2-$ group in one ebthi ligand was disordered over two sites, with refined occupancy factors of 0.551 (6) and 0.449 (6). The asymmetric unit also contains a toluene solvent molecule.

Related literature

For μ -sulfide-bridged $[\text{Cp}_2\text{M}(\mu\text{-S})_2]$ metallocenes ($\text{Cp} = \text{C}_5\text{H}_5$), see: for $M = \text{Zr}$, Bottomley *et al.* (1986); Hey *et al.* (1987); for $M = \text{Nb}$, Skripkin *et al.* (1984). Furthermore, for $[\text{Cp}'_2\text{Th}(\mu\text{-S})_2]$ ($\text{Cp}' = 1,2,4$ -tri-*tert*-butylcyclopentadienyl), see: Ren *et al.* (2011); for $[\text{Cp}'_2\text{Ta}(\mu\text{-S})_2]$ ($\text{Cp}' = \text{C}_5\text{H}_4\text{Me}$), see: Winkler *et al.* (1998). The starting alkyne complex (ebthi) $\text{Zr}(\eta^2\text{-Me}_3\text{Si-C}_2\text{-SiMe}_3)$ was described by Lefeber *et al.* (1996). For μ -sulfide complexes with a further bridged ligand $\text{Cp}'\text{M}(\mu\text{-S})_2\text{LMCp}'$, $L = \mu_2\text{-}\eta^{10}$ -fulvalene, $\text{Cp}' = \text{Cp}$, $M = \text{Zr}$, see: Wielstra *et al.* (1990), $L = \mu_2$ -bis(η^5 -cyclopentadienyl)-dimethylsilane, $\text{Cp}' = \text{Cp}$, $M = \text{Zr}$, see: Cacciola *et al.* (1992), $L = \mu_2$ -bis(η^5 -cyclopentadienyl)-dimethylsilane, $\text{Cp}' = \text{Cp}^*$ (C_5Me_5), $M = \text{Zr}$, see: Burstynowicz & Petersen (1995).

S1. Comment

The reaction of isothiocyanates with metallocene precursors $L_2M(\eta^2\text{-Me}_3\text{Si-C}_2\text{-SiMe}_3)$ ($L_2 = \text{ebthi, Cp}_2, \text{Cp}^*_2, M = \text{Ti, Zr}$) was investigated with the aim of synthesizing new 4-membered hetero-metallacycles. In this reaction, a C—S bond cleavage occurred leading to two different products. In addition to a dimeric bis(μ -sulfido) bridged zirconium complex, the formation of the organic *N*-adamantyl-isocyanide was observed.

In the title compound each zirconium atom is coordinated by two sulfido and the chelating ebthi ligand (Fig. 1). The geometry at the zirconium centers is strongly distorted tetrahedral. The largest deviation from the ideal tetrahedral angle is observed for S1—Zr2—S2 angle with 89.27 (2)°. The $[\text{ZrS}]_2$ unit is almost planar (mean deviation from the best plane: 0.025 Å); bond lengths and angles of the $[\text{ZrS}]_2$ unit are comparable with those of $[\text{Cp}_2\text{Zr}(\mu\text{-S})_2]$ (Bottomley *et al.*, 1986 and Hey *et al.*, 1987). Angles between the planes defined by Zr1, S1, Zr2, S2 and each of the five-membered rings of the ebthi ligands are 31.67 (8)° and 28.28 (5)° (for the ligand coordinated to Zr2), 30.74 (5)° and 28.86 (9)° (for the ligand coordinated to Zr1), respectively. The asymmetric unit of the title compound also contains a toluene solvent molecule.

S2. Experimental

To a solution of 469 mg (0,892 mmol) of (ebthi)Zr(η^2 -Me₃Si—C₂—SiMe₃) in 15 ml of *n*-hexane was added dropwise a solution of 172 mg (0,892 mmol) *N*-adamantylisothiocyanate in 10 ml of *n*-hexane. Instantly, the reaction mixture turned from green to dark red and a colourless solid precipitated. The reaction mixture was allowed to stand for 12 h. After filtration, the dark red solution was evaporated *in vacuo*. The precipitate was dissolved in 8 ml of toluene, filtered and stored at -40°C. After 7 days, the dark red crystalline product was filtered, washed with cold toluene and dried *in vacuo*. Yield: 79% (273 mg, 0.212 mmol). Crystals suitable for X-ray analysis were obtained from a saturated solution in toluene at -40°C.

S3. Refinement

H atoms were placed in idealized positions with $d(\text{C—H}) = 0.95 \text{ \AA}$ (CH), 0.99 Å (CH₂) and 0.98 Å (CH₃) and refined using a riding model with $U_{\text{iso}}(\text{H})$ fixed at 1.2 $U_{\text{eq}}(\text{C})$ for CH, CH₂ and 1.5 $U_{\text{eq}}(\text{C})$ for CH₃. Atoms C25A, C26A and C25B, C26B are disordered over two sites with occupancies of 0.551 (6):0.449 (6). The SADI instruction was used to improve the geometry of this disordered part of the complex molecule. The largest diff. peak/hole (1.30/-0.89 e Å⁻³) were 0.58 Å from C26B and 0.36 Å from C25B, respectively. Additional difference map peaks of 0.97 and 0.89 e Å⁻³ were consistent with disorder of atoms C17 and C18, but was not modelled owing to the low occupancy and comparatively poor definition of the minor component.

Figure 1

The molecular structure of the title compound with 30% displacement ellipsoids. Hydrogen atoms are omitted for clarity. Minor disorder is indicated by open bonds.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
