Received 22 November 2012; accepted 23 November 2012

Key indicators: single-crystal X-ray study; $T = 120\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$;
 R factor = 0.033; wR factor = 0.082; data-to-parameter ratio = 21.3.

In the title compound, $[\text{Fe}(\text{C}_{11}\text{H}_{20}\text{N}_2)_2(\text{CO})_3]$, the Fe atom shows a distorted trigonal-bipyramidal geometry with three carbonyl and two carbene ligands. The latter have a *cis* arrangement, with a $\text{C}-\text{Fe}-\text{C}$ angle of $90.60(7)^\circ$. The Fe atom lies $0.007(1)\text{ \AA}$ above the basal plane defined by two carbonyl and one carbene C atoms. The molecular structure is closely related to that of the isomolecular but not isotropic Ru complex with an identical *cis* arrangement, so, in general, bond geometries lie in expected ranges. In the crystal, $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds link the molecules into infinite zigzag chains extending along [010].

Related literature

Tricarbonylbis(1,3-diisopropyl-4,5-dimethylimidazol-2-ylidene)iron

Aziza Ahmida, Ulrich Flörke and Gerald Henkel

S1. Experimental

To a solution of 1,3-diisopropyl-4,5-dimethylimidazol-2-thione (850 mg, 4 mmol) in 30 ml THF was added K (420 mg, 1 mmol + 10% excess) and the mixture was refluxed under inert atmosphere for 4 h. After filtration and removal of K_2S , $Fe_2(CO)_9$ (360 mg, 1 mmol) was added to the filtrate. The reaction mixture was stirred over night at room temperature. After removal of the solvent and subsequent drying in vacuum the residue was crystallized by diffusion of hexane into a concentrated toluene solution to give single-crystal of the title complex.

S2. Refinement

All Hydrogen atom positions were clearly derived from difference maps, then refined at calculated positions riding on the parent atoms with C—H 0.98 - 1.00 Å and isotropic displacement parameters $U_{iso}(H) = 1.2U(C_{eq})$ or $1.5U(-CH_3)$. All CH_3 hydrogen atoms were allowed to rotate but not to tip.

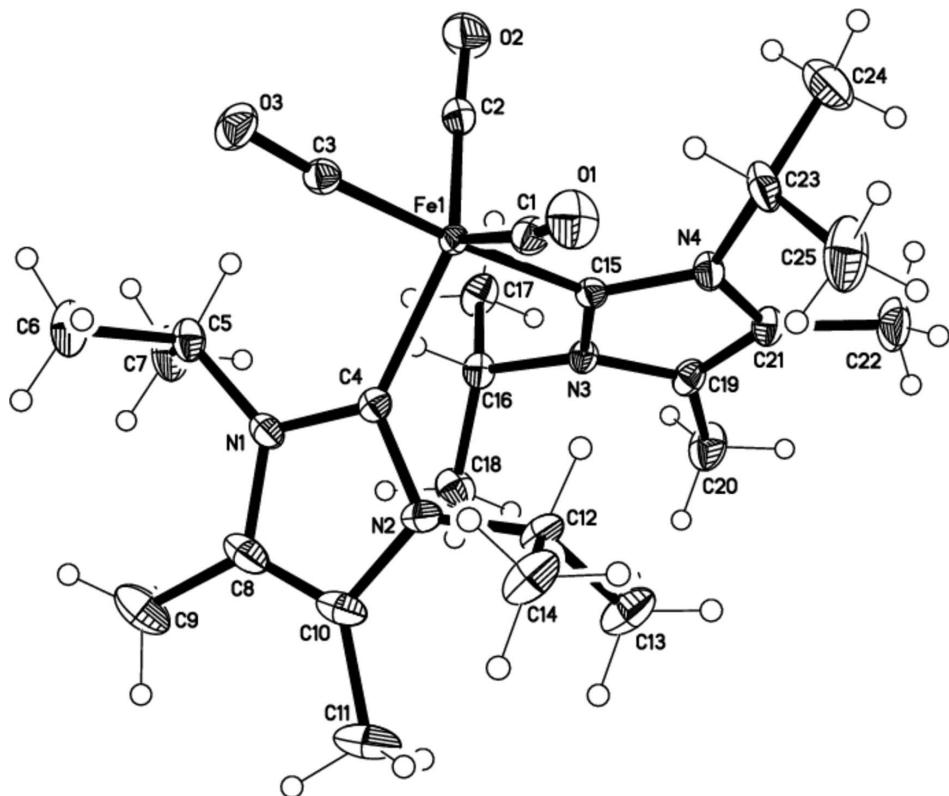

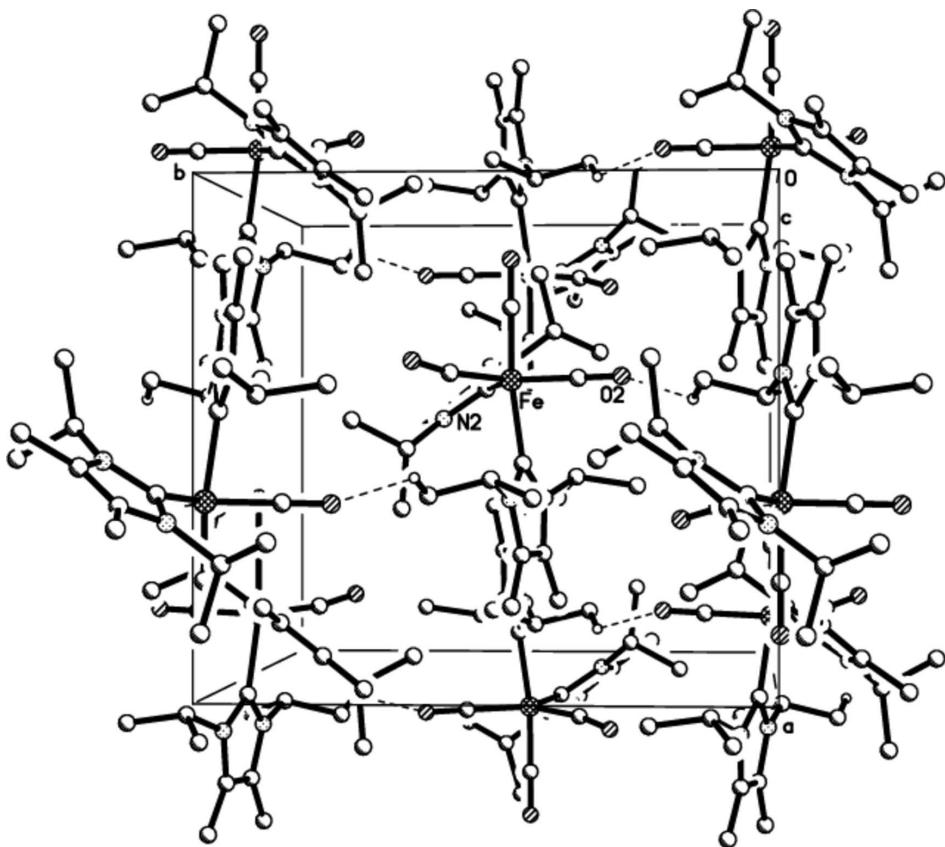

Figure 1

Molecular structure of the title compound. Displacement ellipsoids are drawn at the 50% probability level.

**Figure 2**

Crystal packing viewed along [001] with hydrogen bonding pattern indicated as dashed lines. H-atoms not involved in bonding are omitted.

Data collection

Bruker SMART CCD area-detector
diffractometer

Radiation source: sealed tube

Graphite monochromator

φ and ω scans

Absorption correction: multi-scan
(SADABS; Sheldrick, 2004)

$T_{\min} = 0.803$, $T_{\max} = 0.844$

26635 measured reflections

6362 independent reflections

5983 reflections with $I > 2\sigma(I)$
 $R_{\text{int}} = 0.035$
 $\theta_{\text{max}} = 28.1^\circ, \theta_{\text{min}} = 2.0^\circ$

$h = -15 \rightarrow 15$
 $k = -16 \rightarrow 16$
 $l = -23 \rightarrow 23$

Refinement

Refinement on F^2
Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.033$
 $wR(F^2) = 0.082$
 $S = 1.04$
6362 reflections
298 parameters
0 restraints
Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map
Hydrogen site location: difference Fourier map
H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + (0.0461P)^2 + 0.1759P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\text{max}} = 0.002$
 $\Delta\rho_{\text{max}} = 0.42 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\text{min}} = -0.23 \text{ e } \text{\AA}^{-3}$
Absolute structure: Flack (1983), 2789 Friedel pairs
Absolute structure parameter: 0.022 (11)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
