Received 17 October 2012; accepted 25 October 2012

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$ ;  $R$  factor = 0.055;  $wR$  factor = 0.128; data-to-parameter ratio = 8.1.

The title compound,  $C_{12}H_{14}N_2O$ , was obtained by reaction of ( $\pm$ )-1-(1*H*-benzimidazol-2-yl)ethanol with 3-bromoprop-1-ene. The asymmetric unit contains four crystallographically independent molecules. In the crystal, molecules 1 and 2 are linked via  $\text{O}-\text{H}\cdots\text{N}$  hydrogen bonds, forming chains propagating along [010]. Molecules 3 and 4 are linked to these chains via  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds.

## ( $\pm$ )-1-(1-Allyl-1*H*-benzimidazol-2-yl)ethanol

Dong-Ping Li, Min Li, Shuai Li and Hang-Na Hu

### S1. Comment

Benzimidazole and its derivatives are important pharmaceutical intermediates and have attracted considerable attention because of good biological and pharmaceutical activities (Matsuno, *et al.*, 2000; Garuti, *et al.*, 1999). These compounds also display other interesting properties as catalysts (Stibraný, 2001) and proton sponges (Stibraný *et al.*, 2002). In this paper, the synthesis and crystal structure of the title compound is reported.

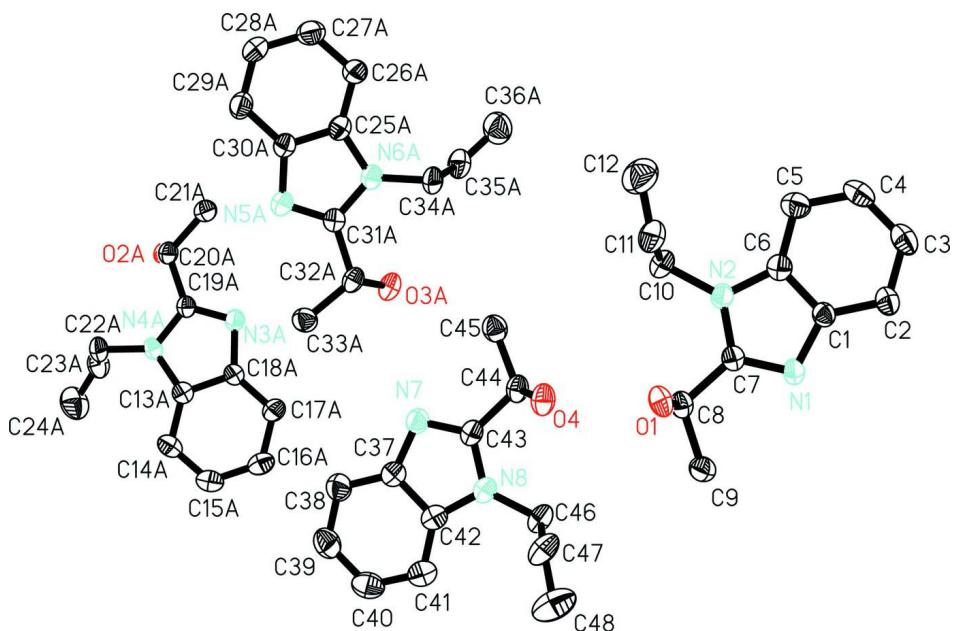

Fig. 1 shows an ORTEP plot of the title compound. There are four crystallographically independent molecules in the asymmetric unit. The C=C bonds are within normal ranges. The four benzimidazole ring systems are substantially planar with the largest deviations from the mean plane of 0.018 (5), 0.008 (5), 0.018 (5) and 0.017 (5) Å for C1–C7/N1/N2, C13–C19/N3/N4, C25–C31/N5/N6 and C37–C43/N7/N8, respectively. In the structure of the title compound (Fig. 2), molecules are connected through intermolecular O—H···N and O—H···O hydrogen bonds into layers parallel to the (110) plane.

### S2. Experimental

All chemicals were obtained from commercial sources and used directly without further purification. ( $\pm$ )-1-(1*H*-benzimidazol-2-yl)ethanol was synthesized according to the literature methos (Xia & Xu, 2008). ( $\pm$ )-1-(1*H*-benzimidazol-2-yl)ethanol (0.81 g, 5 mmol) was dissolved in acetone (10 ml), then 3-bromoprop-1-ene (0.6 g, 5 mmol) and K<sub>2</sub>CO<sub>3</sub> (0.83 g, 6 mmol) was added to the solution. The mixture was heated to reflux for 15 h at 70°C. The organic solvent was removed under reduced pressure, and 50 ml chloroform was added. The solid was removed by filtration and washed with chloroform. The combined organic solution was washed with water, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, and the solvent removed under reduced pressure. The residues was purified by chromatography column with CHCl<sub>3</sub> to afford the pure light yellow solid (0.745 g, yield: 74%). <sup>1</sup>H-NMR(CDCl<sub>3</sub>, 500 MHz): δ 1.69 (d, 3 H), 3.66(br, 1H), 4.80(m, 2H), 4.98(d, 1H), 5.11 (q, 1 H), 5.21(d, 1 H), 5.94(m, 1 H), 7.25(m, 3H), 7.73 (m, 1 H). Single crystals of the title compound suitable for X-ray diffraction analysis were obtained from a methanol solution by slow evaporation after a week.

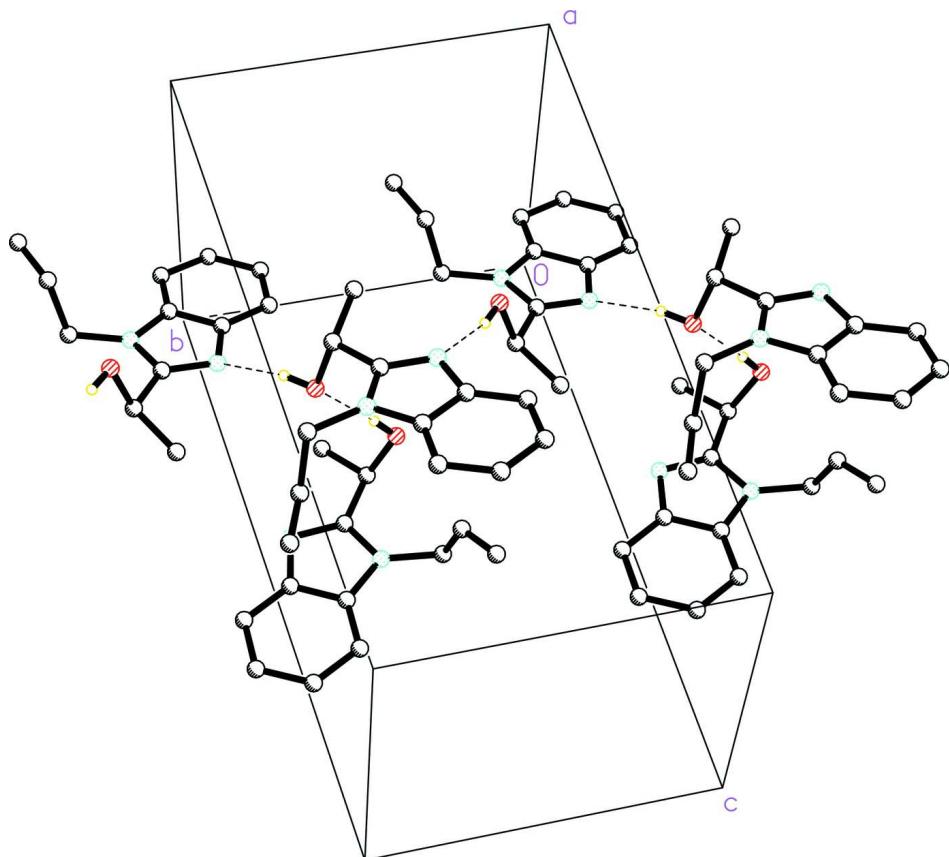

### S3. Refinement

All H atoms attached to C and O atom were fixed geometrically and treated as riding, with C—H = 0.98 Å (methine), 0.96 Å (methyl) or 0.93 Å(aromatic), O—H = 0.82 Å, and with U<sub>iso</sub> (H) = 1.2U<sub>eq</sub> (C) or 1.5U<sub>eq</sub>(C, O) for methyl and hydroxy H atoms. In the absence of significant anomalous scattering, 3937 Friedel pairs have been merged.

**Figure 1**

The molecular structure of the title compound with displacement ellipsoids drawn at the 30% probability level. H atoms are omitted for clarity. For clarity purposes, molecules with atoms labelled with suffix A have been generated by the symmetry operation  $x, y + 1, z$ .

**Figure 2**

Partial crystal packing of the title compound showing the hydrogen bonding network (dashed lines). H atoms not involved in hydrogen bonding are omitted for clarity.

 $l = -18 \rightarrow 18$

### Refinement

Refinement on  $F^2$

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.055$

$wR(F^2) = 0.128$

$S = 1.02$

4404 reflections

541 parameters

3 restraints

Primary atom site location: structure-invariant  
direct methods

Secondary atom site location: difference Fourier  
map

Hydrogen site location: inferred from  
neighbouring sites

H-atom parameters constrained

$w = 1/[\sigma^2(F_o^2) + (0.0586P)^2]$   
where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} < 0.001$

$\Delta\rho_{\max} = 0.16 \text{ e } \text{\AA}^{-3}$

$\Delta\rho_{\min} = -0.19 \text{ e } \text{\AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
