Received 12 November 2012; accepted 3 December 2012

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(C-C) = 0.005 \text{ \AA}$; R factor = 0.059; wR factor = 0.164; data-to-parameter ratio = 17.0.

The title compound, $[\text{Ru}(\text{C}_7\text{F}_5\text{O}_2)_2(\text{C}_{10}\text{H}_{14})(\text{C}_{21}\text{H}_{24}\text{N}_2)] \cdot 2\text{CH}_2\text{Cl}_2$, is formed as an orange crystalline powder by the reaction of $\text{RuCl}_2(p\text{-cymene})(\text{IMes})$ and $\text{AgOCOC}_6\text{F}_5$ in anhydrous tetrahydrofuran ($\text{IMes} = 1,3$ -dimesityl-2,3-dihydro-1*H*-imidazol-2-ylidene). The asymmetric unit consists of two independent $[\text{Ru}(\text{C}_6\text{F}_5\text{COO})_2(\eta^6\text{-}p\text{-cymene})(\text{IMes})]$ complexes and four dichloromethane solvent molecules. In each complex molecule, the Ru atom presents a pseudo-octahedral environment with the *p*-cymene ligand occupying three facial coordination sites, while the remaining coordination positions are occupied by the O atoms of the pentafluorobenzoate ligands and by the imidazolylidene ligand.

S1. Comment

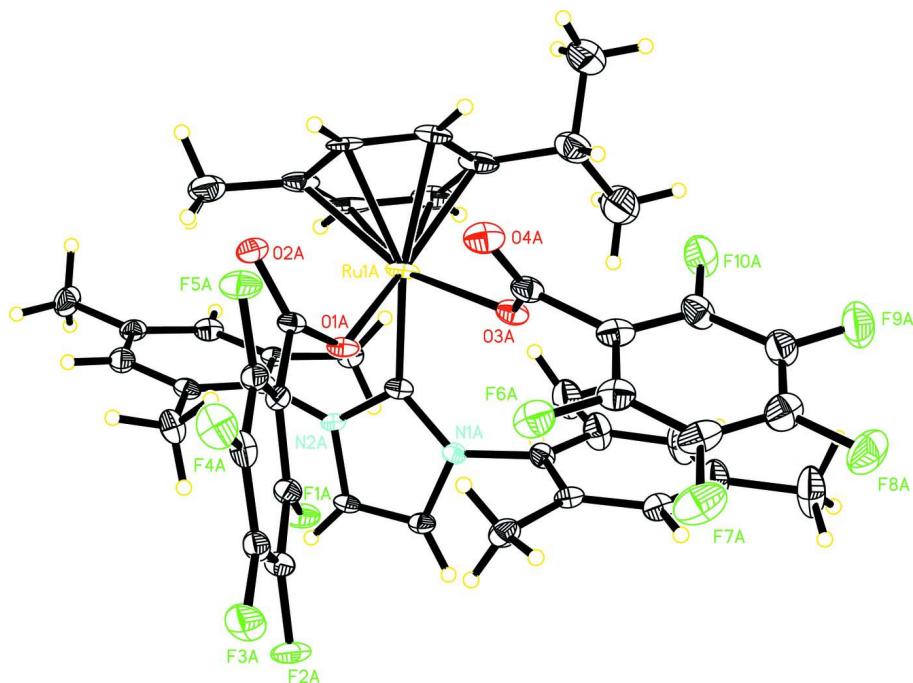

In the last years, the design and synthesis of latent olefin metathesis precatalysts has received considerable attention. Due to their latency, they exhibit no catalytic activity at low (usually ambient) temperature in the presence of monomer or substrate, but can be triggered quantitatively to a highly active form. This activation can be caused by a variety of different stimuli, *e.g.*, light activation to initiate metathesis reactions. Such precatalysts are of particular interest in technical applications of ROMP, since they allow for being mixed with the monomers, its storage over a longer period of time even at elevated temperatures without concomitant polymerization (Buchmeiser *et al.* 2007, Monsaert *et al.* 2009). The title compound (Figure 1), an intermediate product for the synthesis of a photo-latent metathesis catalyst, was obtained by the reaction of RuCl₂(*p*-cymene)(IMes) and AgOCOC₆F₅ in anhydrous THF (IMes = 1,3-dimesityl-2,3-dihydro-1*H*-imidazol-2-ylidene). It crystallizes in the space group P2₁/n (*Z*=8) with accompanying CH₂Cl₂ solvate molecules. Selected geometric parameters are given in table 1. The structure exhibits a typical three legged piano stool structure with Ru^{II} coordinated by one carbon atom of the N-heterocyclic carbene ligand and two oxygen atoms of the pentafluorobenzoate ligands. The coordination geometry around Ru is that of a distorted octahedron in which three sites are occupied by the η^6 -*p*-cymene ligand, two by the pentafluorobenzoate ligands and one by the N-heterocyclic carbene. The structure is closely similar to that of recently reported compound Ru(CF₃COO)(*p*-cymene)(IMes) (Zhang *et al.* 2006).

S2. Experimental

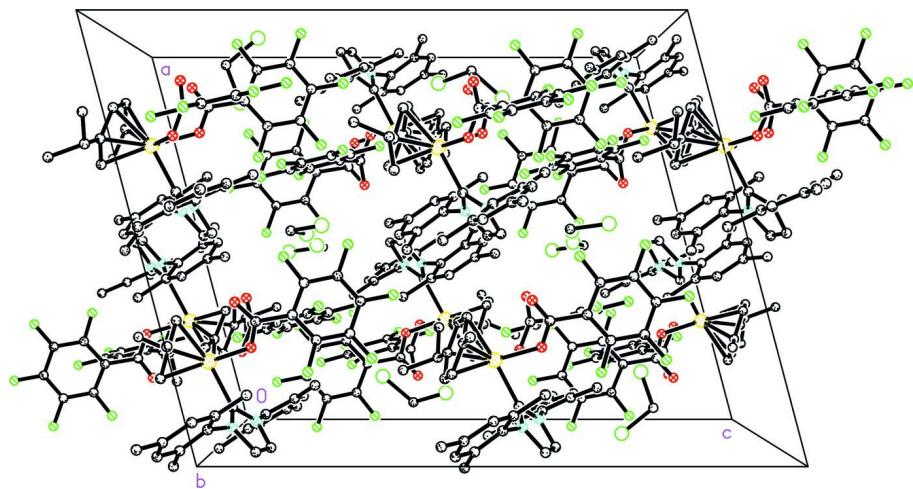

A solution of silver pentafluorobenzoate (356.9 mg, 1.12 mmol) in 10 ml of anhydrous THF was added to a solution of RuCl₂(IMes)(*p*-cymene) (328.5 mg, 0.54 mmol) in 10 ml of anhydrous THF under stirring. After 4 h the mixture was filtered through a short bed of celite and THF was removed *in vacuo*. Dichloromethane was added to dissolve the residues and the solution was filtered through glass-fiber paper and concentrated *in vacuo*. Diethyl ether was layered over the red, saturated CH₂Cl₂ solution. Red crystals suitable for X-ray analysis formed at -36°C. Yield: 310 mg (60%).

S3. Refinement

H atoms were located from difference fourier maps, but were refined with fixed individual displacement parameters [U_{iso}(H) = 1.2 U_{eq}(C) or U(H) = 1.5 U_{eq}(C-methyl-)] using a riding model with C—H ranging from 0.95 to 1.0 Å. In addition, the methyl groups were allowed to rotate but not to tip.

**Figure 1**

Molecular structure of the title molecule with displacement ellipsoids drawn at the 50% probability level. H atoms have been omitted for clarity.

**Figure 2**

A view of the unit-cell contents of the title compound.

 $\Delta\rho_{\min} = -2.32 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors (gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
