Received 22 December 2012; accepted 5 January 2013

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.038; wR factor = 0.103; data-to-parameter ratio = 13.9.

In the title compound, $\text{C}_{26}\text{H}_{22}\text{N}_2\text{O}_4$, the pyrrolidine ring adopts a twisted conformation and the other five-membered rings adopt envelope conformations with the spiro C atoms as the flap atoms. The naphthalene ring system of the dihydroacenaphthylene group forms dihedral angles of 89.2 (9) and 75.5 (6) $^\circ$ with the pyrrolidine and indole rings, respectively. The pyrrolidine ring makes a dihedral angle of 80.1 (9) $^\circ$ with the indole ring. In the crystal, molecules are linked by weak $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds, forming chains along the b -axis direction.

S1. Comment

Naphthalene derivatives have manifested applications in many fields, for example, as a colorant, explosive, disinfectant, insecticide and plant hormone auxin. Naphthalene is believed to play a role in the chemical defence against biological enemies (Wiltz *et al.*, 1998; Wright *et al.*, 2000). It may be produced by metabolic processes in termites or by associated microorganisms which inhabit, e.g., the termite guts (Varma *et al.*, 1994). In view of these importance and continuation of our work on the crystal structure analysis of naphthalene derivatives, the crystal structure of the title compound has been carried out and the results are presented here.

X-Ray analysis confirms the molecular structure and atom connectivity as illustrated in Fig. 1. The geometry of acenaphthylene and pyrrolidine ring systems are comparable with the related structure [Wei *et al.* (2012)]. The sum of the angles at N1 [338.2 (1) $^\circ$] and N2 [359.4 (1) $^\circ$] of the pyrrolidine rings are in accordance with sp^3 and sp^2 hybridizations. The naphthalene ring system of the dihydroacenaphthylene group [C7–C16] forms dihedral angles of 89.2 (8) and 75.5 (5) $^\circ$ with the central pyrrolidine ring [N1/C2–C5] and the indole ring [N2/C4/C17–C23], respectively. It clearly shows that the naphthalene ring system of the dihydroacenaphthylene group attached to the central pyrrolidine ring are almost perpendicular to each other. Also the dihedral angle between the central pyrrolidine and the indole ring forms a a dihedral angle of 80.1 (8) $^\circ$.

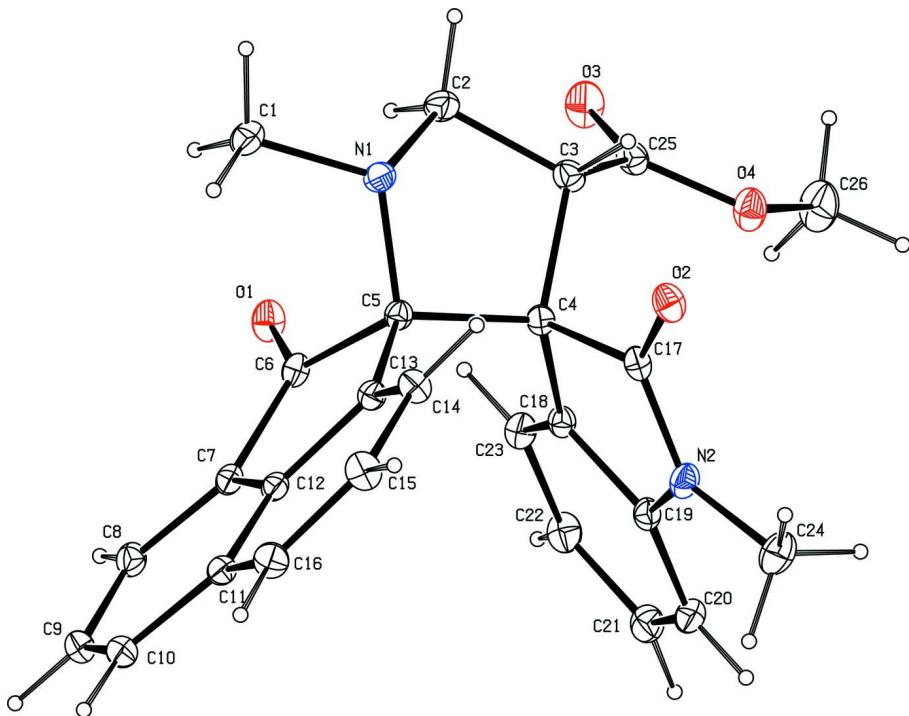

The central pyrrolidine ring adopts twisted conformations on N1 and C2 atoms with the pukering parameter of $q_2 = 0.3942$ (2) Å, $\varphi = 13.72$ (3) $^\circ$ (Cremer & Pople, 1975). The pyrrolidine ring [N2/C4/C17–C19] in the indole group adopts envelope conformations, $q_2 = 0.0889$ (2) Å and $\varphi = 219.39$ (1) $^\circ$, and with atom C17 deviating -0.0565 (2) Å from the least-squares plane passing through the remaining four atoms (N2/C19/C18/C4) of that ring. In the crystal the molecules are linked by weak intermolecular C—H \cdots O hydrogen bonds (Table 1), forming one-dimensional chains along the *b*-axis.

S2. Experimental

To a mixture of 1eq of (*E*)-methyl 2-(1-methyl-2-oxoindolin-3-ylidene) acetate, 1eq of isatin and 1.5eq of acenaphthylene-1,2-dione were dissolved in acetonitrile. This reaction mixture refluxed at 80°C for 8 hours. The reaction mixture was monitored for completion by thin layer chromatography. Upon completion, the reaction mixture was extracted with ethyl acetate and water. The product was dried and purified by column chromatography using ethyl acetate and hexane (1:9) as an eluent to afford pure Dispiro oxindole. Yield (78%). Single crystals suitable for X-ray diffraction were obtained by slow evaporation of a solution of the title compound in ethyl acetate at room temperature.

S3. Refinement

All H atoms were fixed geometrically and allowed to ride on their parent C atoms, with C—H distances fixed in the range 0.93–0.97 Å with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methyl H 1.2 $U_{\text{eq}}(\text{C})$ for other H atoms. The positions of methyl hydrogens were optimized rotationally.

**Figure 1**

The molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are presented as small spheres of arbitrary radius.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
