Correspondence e-mail: zhugang80@163.com

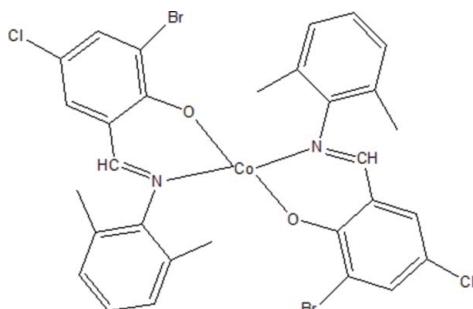

Received 28 January 2013; accepted 6 February 2013

Key indicators: single-crystal X-ray study; $T = 153 \text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004 \text{ \AA}$; R factor = 0.044; wR factor = 0.119; data-to-parameter ratio = 21.7.

In the title complex, $[\text{Co}(\text{C}_{15}\text{H}_{12}\text{BrClNO})_2]$, the Co^{II} ion is coordinated by two N,O -bidentate 2-bromo-4-chloro-6-[*(E*)-(2,6-dimethylphenyl)iminomethyl]phenolate ligands, generating a squashed Co_2O_2 tetrahedral coordination geometry. The dihedral angles between the aromatic rings in the ligands are 82.60 (14) and 71.79 (14) $^\circ$. The complex has approximate local noncrystallographic twofold symmetry. In the crystal, weak aromatic $\pi-\pi$ stacking is observed [centroid–centroid separation = 3.6434 (18) \AA].

Bis{2-bromo-4-chloro-6-[*(E*)-(2,6-dimethylphenyl)iminomethyl]phenolato- κ^2N,O }cobalt(II)

Gang Zhu and Bao-Juan Jiao

S1. Comment

Schiff bases possess strong coordination function and may act as bi-, tri-, and poly-dentate ligands to yield plenty of mono-, bi-, tri-, and poly-nuclear Schiff-base complexes, so the design of metal-organic coordination polymers is of current interest in the fields of supramolecular chemistry and crystal engineering because of their potential applications as functional materials (Feng, *et al.*, 2008; Liu, *et al.*, 2009). Meanwhile, Schiff bases and their metal complexes exhibit biological activity as antibiotics, antiviral and antitumour agents because of their specific structures (Billson, *et al.*, 2000; Carlton, *et al.*, 1995). Thus, it is quite important to have a good understanding of the structure of such metal complexes.

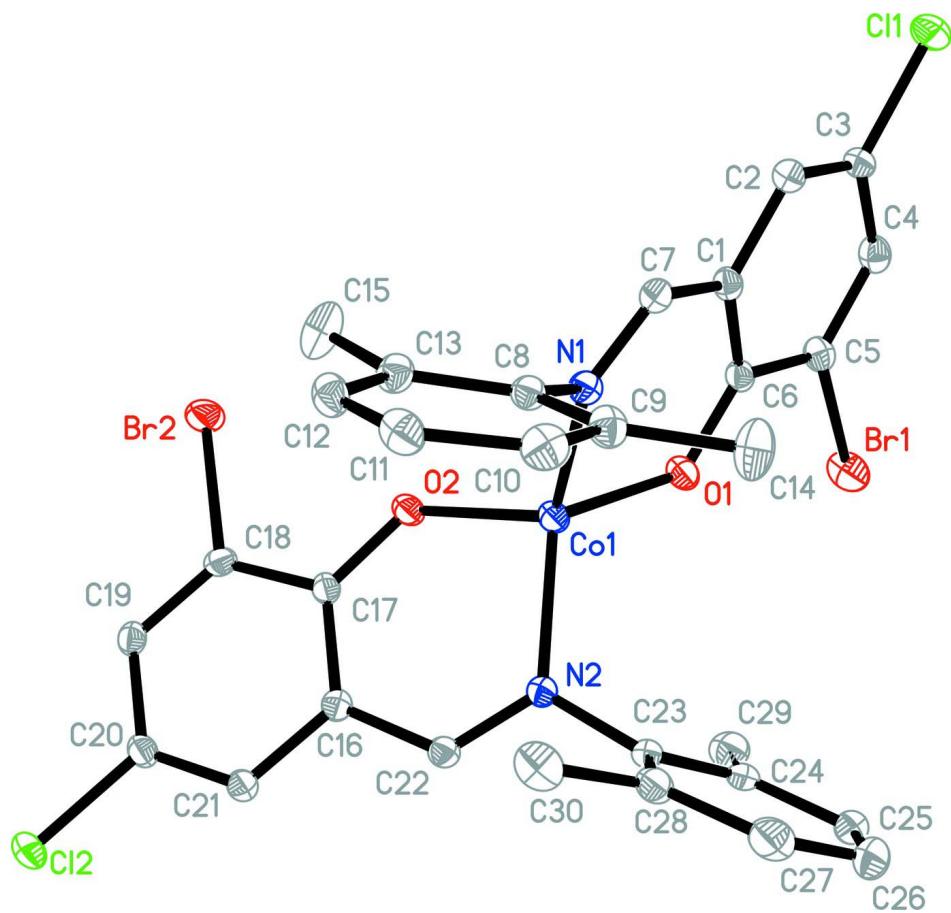

In this paper, we report synthesis and crystal structure of a new cobalt(II) complex, bis[2-((*E*)-(2,6-dimethylphenyl)imino)methyl]-6-bromo-4-chlorophenol)cobalt(II). The structure of the complex had been established accurately from the X-ray single-crystal diffraction study. The Co(II) ion in the monomeric unit seems to reside in a distorted tetrahedral environment and bonds to two oxygen atoms and two nitrogen atoms from two Schiff bases.

A thermal ellipsoid drawing and crystal packing structure of the title complex are shown in Figure 1 and Figure 2. The $\text{Co}(\text{C}_{15}\text{H}_{12}\text{BrClNO})_2$ motif is asymmetrical with Co—N and Co—O bonds, the corresponding distances are $d(\text{Co—N}1) = 2.000$ (2), $d(\text{Co—O}1) = 1.9144$ (18), $d(\text{Co—N}2) = 1.983$ (2), $d(\text{Co—O}2) = 1.9006$ (2) Å. The cobalt atom is in a distorted tetrahedral environment, where the values of *trans* bond angles also indicate the coordination environment with O(2)—Co(1)—N(1), O(2)—Co(1)—N(2) and O(2)—Co(1)—O(1) angles of 116.97 (9), 94.94 (8) and 113.77 (8) °, respectively.

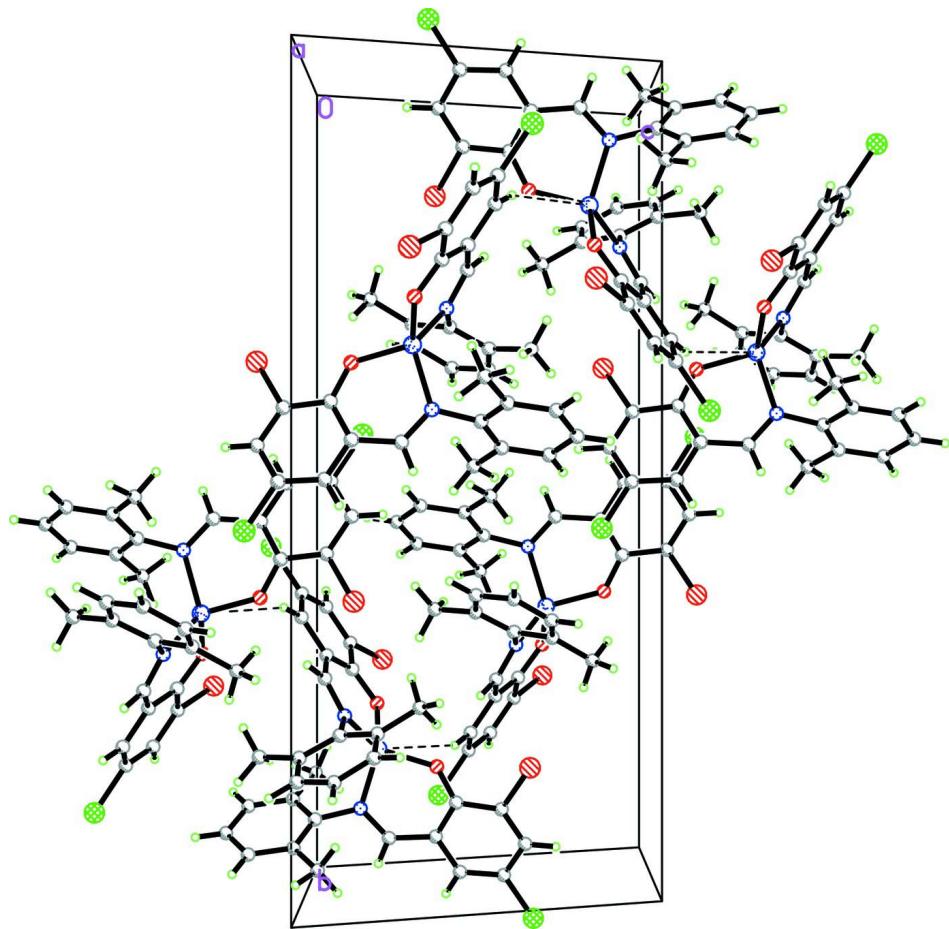

In the crystal structure of the complex the atoms of the phenyl ring plane A (C(1) C(2) C(3) C(4) C(5) C(6)) and the chelate ring formed by the same ligand plane B ((O(1)/Co(1)/N(1)/C(7)/C(1)/C(6))) are nearly coplanar with a dihedral angle of 8.09 (10) °. Because of the conjugation effects through the imino double bond N(1)=C(7), the phenyl ring A and the phenyl ring C (C(8) C(9) C(10) C(11) C(12) C(13)) joined by the N(1)=C(7) bond, are non-coplanar (with the dihedral angle 74.55 (7) °, decreasing the steric effects between the two rings. If the two chelate planes, planes B and D((N(2)/Co(1)/O(2)/C(17)/C(16)/C(22)), are compared the dihedral angle is 87.19 (6) °, nearly perpendicular.

S2. Experimental

3-Bromo-5-chlorosalicylaldehyde (0.2 mmol, 47.2 mg) and 2,6-Dimethylaniline (0.2 mmol, 24.2 mg) were dissolved in EtOH (15 mL). The mixture was stirred for 30 min at room temperature to give an orange solution. To the resulting orange solution was added $\text{Co}(\text{CH}_3\text{COO})_2$ (0.1 mmol, 17.7 mg). Then a clear brown solution was obtained. The title complex were obtained from the solution after 4 d in the form of red chunks. The product was filtered, washed with EtOH, and dried over anhydrous CaCl_2 *in vacuo* overnight. Yield: 70%. Anal. Calcd. (%) for $\text{C}_{30}\text{H}_{24}\text{CoN}_2\text{O}_2\text{Cl}_2\text{Br}_2$: C, 49.08; H, 3.29; N, 3.82. Found (%): C, 49.13; H, 3.43; N, 3.70.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
