Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(C-C) = 0.002 \text{ \AA}$ ;  $R$  factor = 0.030;  $wR$  factor = 0.076; data-to-parameter ratio = 12.0.

Stevioside is a naturally occurring diterpenoid glycoside in *Stevia rebaudiana* Bertoni. The title compound,  $C_{38}H_{60}O_{18} \cdot 4CH_3OH$ , crystallized as its methanol tetrasolvate. Stevioside consists of an aglycone steviol (a tetracyclic diterpene in which the four-fused-ring system consists of three six-membered rings and one five-membered ring) and a sugar part (three glucose units). A weak intramolecular O—H···O hydrogen bond occurs. In the crystal, the methanol molecules participate in a two-dimensional hydrogen-bonded network parallel to  $b$  axis with the sugars and together they form a hydrophilic tunnel which encloses the lipophilic part of the molecule.

## Stevioside methanol tetrasolvate

**Yunshan Wu, Douglas L. Rodenburg, Mohamed A. Ibrahim, James D. McChesney and Mitchell A. Avery**

### S1. Comment

Stevia rebaudiana Bertoni (Asteraceae), first identified in 1905 by the botanist Bertoni, is a perennial bush indigenous to the mountainous regions of Paraguay and Brazil, and is well known to produce a mixture of high-potency sweet compounds that have been in the market since the 1970's as low-calorie sweeteners (Bertoni, 1905; Kinghorn, 2002). Stevioside is one of these low-calorie sweeteners. The native cultures of Paraguay and Brazil have safely used stevia for sweetening for centuries. The Joint FAO/WHO Expert Committee on Food Additives has established a monograph for Steviol Glycosides (JECFA, 2010). The United States Food and Drug Administration granted regulatory acceptance of Rebaudioside A (FDA, 2008) and mixtures of steviol glycosides (FDA, 2010) followed by the European Union approved steviol glycosides for marketing (OJ, 2011). The world demand for Stevia leaves is expected to exceed 6–8 million metric tonnes in the next 10 years. Stevioside and Rebaudioside A, also known as Rebiana, are the major glycoside sweeteners from *S. rebaudiana* which have been commercialized for human consumption throughout the world (Prakash *et al.* 2008; Wölwer-Rieck, 2012).

Stevioside has several different polymorph forms (Prakash & Upadhyay, 2011). These polymorph forms include methanol or ethanol solvate, hydrate and amorphous. These different polymorphic forms would affect the physical properties like melting point, solubility and density. The powder X-ray patterns of these forms have been documented; however, no single-crystal results have been reported so far. Here we report the structure of stevioside methanol solvate.

The asymmetric unit contains one stevioside and four methanol molecules (Fig. 1). Stevioside has an aglycone portion and a sugar portion. The aglycone is a tetracyclic diterpene in which the four fused ring system consists of three six membered rings and one five membered ring. Rings A, B and C form chair conformations with the puckering parameter (Cremer & Pople, 1975)  $Q = 0.550$  (2) Å,  $\theta = 175.6$  (2) $^\circ$  and  $\varphi = 255$  (3) $^\circ$ ;  $Q = 0.5753$  (17) Å,  $\theta = 166.72$  (17) $^\circ$  and  $\varphi = 191.3$  (8) $^\circ$ ;  $Q = 0.6355$  (17) Å,  $\theta = 24.09$  (16) $^\circ$  and  $\varphi = 281.3$  (4) $^\circ$ , respectively. The five-membered ring D forms an envelope conformation with the puckering parameter  $Q = 0.4791$  (19) Å,  $\varphi = 24.6$  (2) $^\circ$ . These ring systems form the hydrophobic part of the molecule. The three sugars are all  $\beta$ -D glucopyranoses (E, F, G) and they all form chair conformations with the puckering parameters  $Q = 0.5660$  (17) Å,  $\theta = 9.94$  (16) $^\circ$ ,  $\varphi = 4.3$  (10) $^\circ$ ,  $Q = 0.6026$  (17) Å,  $\theta = 3.01$  (16) $^\circ$ ,  $\varphi = 72$  (3) $^\circ$  and  $Q = 0.5861$  (19) Å,  $\theta = 1.56$  (18) $^\circ$ ,  $\varphi = 358$  (7) $^\circ$ , respectively. One sugar is attached to the carboxylic acid functional group at C4 while the other two sugars are linked as 2 $\rightarrow$ 1 and attached to C13. The sugar attached to the carboxylic group at C4 has been shown to be linked on an axial position instead of an equatorial position.

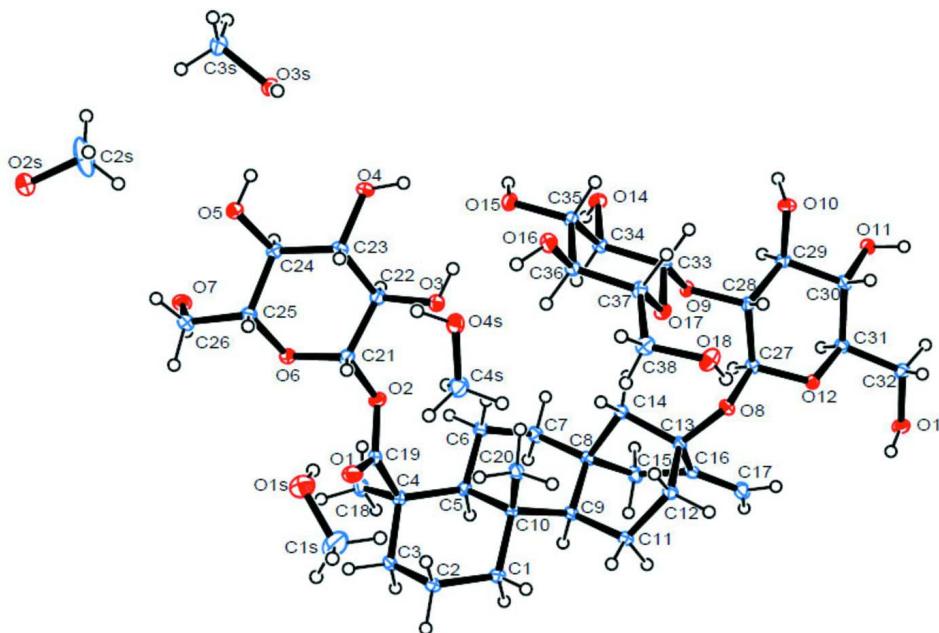

Stevioside and four methanol molecules were stabilized by an extensive hydrogen bonding network and a weak O4—H4O $\cdots$ O15 intramolecular interaction (Table 1). These hydrogen bonds and weak interaction further link two adjacent asymmetric units to form a hydrophilic layer. The aglycon part of the stevioside forms a hydrophobic nucleus. This bilayer system acts like an oil in water system (Fig. 2). This is believed to increase the solubility of stevioside.

**S2. Experimental**

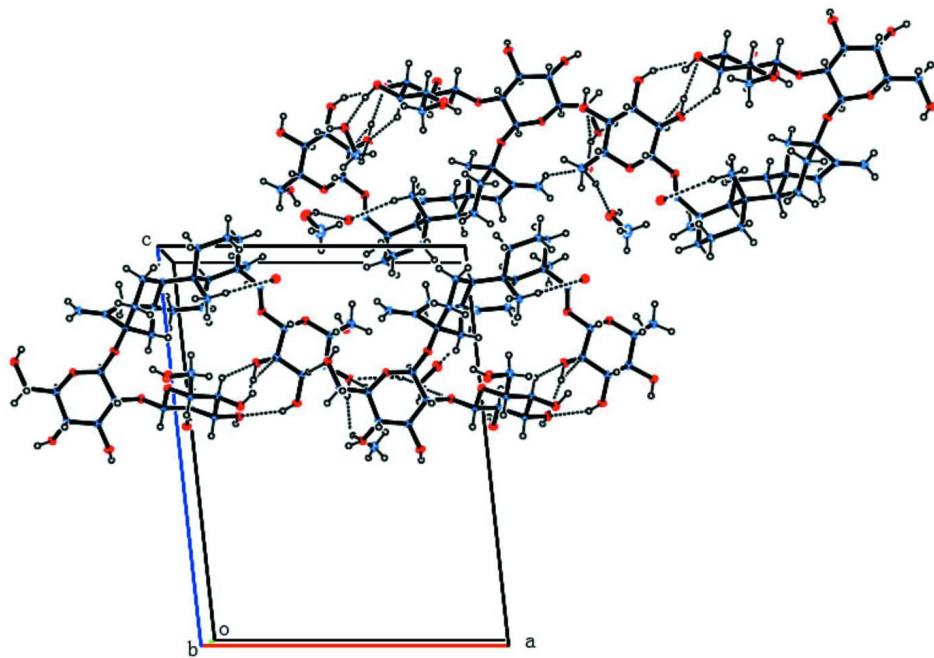

The title compound was isolated by selective crystallization from a commercially available extract of Stevia rebaudiana. The composition of the extract was approximately 42% Rebaudioside A, 31% Stevioside, 10% Rebaudioside C by HPLC analysis with the remaining 13% of the extract being minor steviol glycoside components. Stevioside was crystallized from a 90/10 v/v methanol/water mixture containing dissolved extract. The isolated Stevioside was then re-crystallized from methanol to greater than 95% purity, and further re-crystallized to produce crystals suitable for crystallography.

**S3. Refinement**

All the H atoms were placed in their calculated positions and then refined using the riding model with Atom—H lengths of 1.00 Å (CH), 0.99 Å (CH<sub>2</sub>) or 0.98 Å (CH<sub>3</sub>). Isotropic displacement parameters for these atoms were set to 1.2 (CH, CH<sub>2</sub>) or 1.5 (CH<sub>3</sub>) times  $U_{\text{eq}}$  of the parent atom. H atoms on hydroxyl were initially found in the difference map and then constrained to their parent atoms as riding model with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$  of parent atoms.

**Figure 1**

Molecular structure of stevioside methanol solvate with displacement ellipsoids at 30% probability level.

**Figure 2**

Packing diagram of the title compound viewed along the *b* axis. Dashed lines indicate O—H···O hydrogen bonds and weak O—H···O intermolecular interactions. Hydrogen atoms not involved in hydrogen bonding have been deleted for clarity.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
