Received 26 January 2013; accepted 16 March 2013

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.030; wR factor = 0.085; data-to-parameter ratio = 10.0.

In the title hydrated salt, $\text{C}_4\text{H}_{12}\text{N}_2^{2+} \cdot 2\text{C}_{10}\text{H}_5\text{O}_8^- \cdot 2\text{H}_2\text{O}$, the piperazinium cation, lying about an inversion center, adopts a chair conformation. The benzene ring of the anion makes dihedral angles of $25.17(8)^\circ$ with the carboxylate group and angles of $8.50(7)$, $20.07(7)$ and $80.86(8)^\circ$ with the three carboxylic acid groups. In the crystal, the cations, anions and water molecules are connected by $\text{O}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds into double layers parallel to (110).

Piperazine-1,4-diium bis(2,4,5-tricarboxybenzoate) dihydrate

Nagaraju Narayananam, Kranthi Kumar Gangu, Balakrishna Kurra and Saratchandra Babu Mukkamala

S1. Comment

Benzene-1,2,4,5-tetracarboxylic acid (H_4btc) with its ability to donate four protons is a versatile ligand in building supramolecular architectures and proton transfer compounds with nitrogen containing organic amines such as piperazine (Aghabozorg *et al.*, 2008; Vaidhyanathan *et al.*, 2002) and diethylenetriamine (Pasban *et al.*, 2012). A number of proton transfer compounds and supramolecular architectures were reported earlier with H_4btc and other organic bases such as 1,10-phenanthroline (Chiwei *et al.*, 2005) and propane-1,2-diammonium (Pasdar *et al.*, 2010). These proton transfer compounds have the ability to absorb various metals into their crystal lattices (Aghabozorg *et al.*, 2006) with profound applications in metal separation and storage (Aghabozorg *et al.*, 2010; Smith *et al.*, 2008; Smith & Wermuth, 2010).

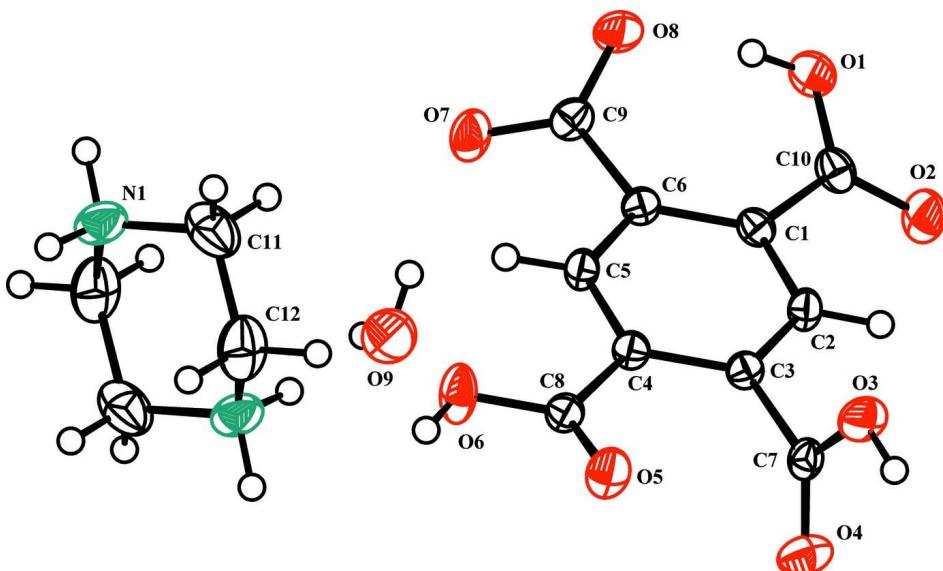

We report here one such proton transfer compound, piperazinediium bis(benzene-1,2,4,5-tetracarboxylate) dihydrate. As shown in Fig. 1, the asymmetric unit contain one mono-deprotonated residue of benzene-1,2,4,5-tetracarboxylic acid (H_3btc^-), a half of diprotonated piperazine (pipz) and one water molecule. Layered 2D supramolecular structure of title compound was built by connecting H_3btc^- , pipz and water molecules through hydrogen bonding (Fig.2). Inter- and intramolecular hydrogen bonding was observed between H_3btc^- -molecular species through $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds. Piperazinediium cations and water molecules are involved in building this supramolecular structure through $\text{N}-\text{H}\cdots\text{O}$ and $\text{O}-\text{H}\cdots\text{O}$ bonds. Besides hydrogen bonding, the weak aromatic $\pi-\pi$ stacking interactions between aromatic rings of H_3btc^- -molecules could contribute for further stabilization of this layered supramolecular crystal structure. As shown in Fig. 3, the $\pi-\pi$ stacking interactions between H_3btc^- (intercentroid separation of 3.7954 Å) were found to be in agreement with the reported values (Janiak, 2000). The packing diagram of the title compound is shown in Fig.4.

S2. Experimental

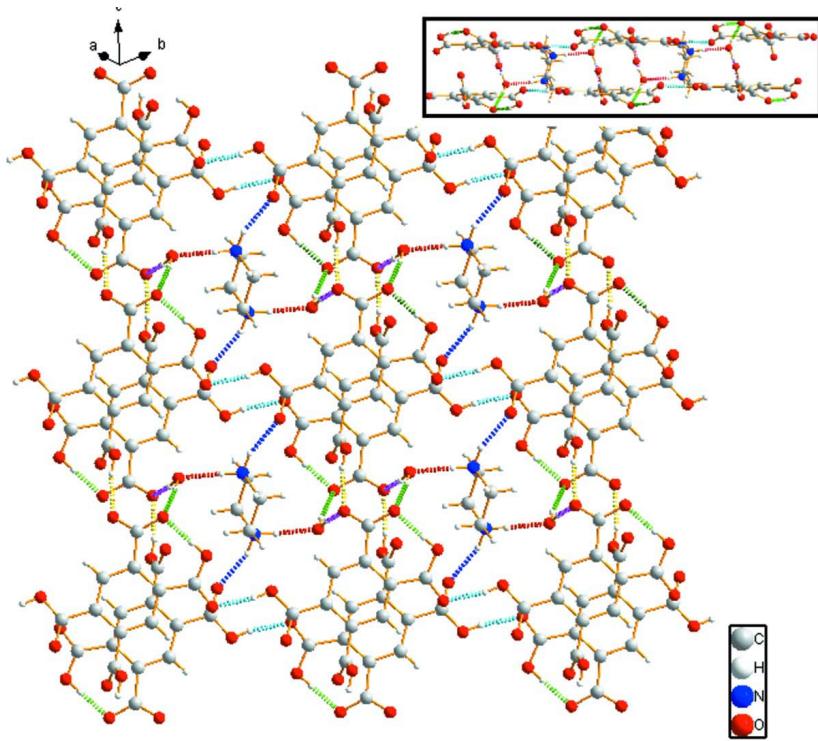

0.2974 g (1.0 mmol) of $\text{Zn}(\text{NO}_3)_2 \cdot 2.6\text{H}_2\text{O}$, 0.1270 g (0.5 mmol) of 1,2,4,5-benzenetetracarboxylic acid, 0.2583 g (3 mmol) of piperazine and 0.2 mL (4 mmol) of sulfuric acid were dissolved in 10.0 mL distilled water and heated in a stainless steel Teflon-lined autoclave at 120°C for 24 hours. The mixture was cooled to room temperature at a cooling rate of 6 °/min. Colorless cubic shaped crystals were obtained from the reaction mixture. Yield: 68% (based on H_4btc). IR (KBr): 3473.27 (s), 3033.5 (w), 2548 (m), 1707 (s), 1621(s), 1475 (m), 734 (s), 596(s), 471(s).

S3. Refinement

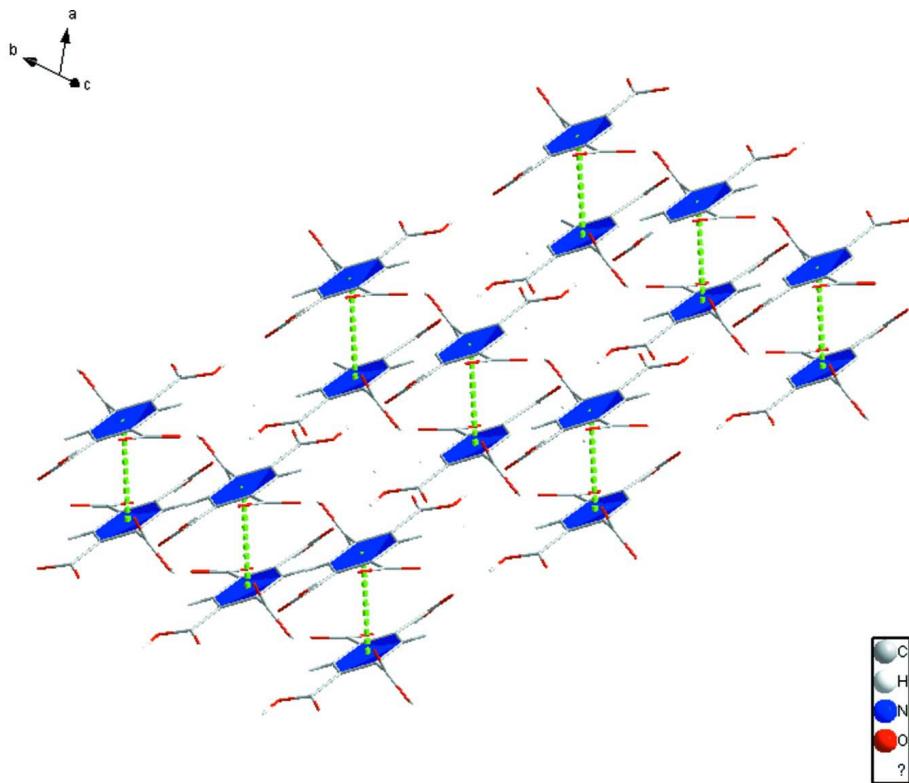

Refinement on F_2 against ALL reflections. The weighted R-factor $w\text{R}_2$ and goodness of fit S were based on F_2 and conventional R-factors R were based on F, with F set to zero for negative F_2 . The threshold expression of $\text{F}_2 > 2\text{sig}(\text{F}_2)$ was used only for calculating R factors(gt) etc. and was not relevant to the choice of reflections for refinement. R-factors based on F_2 were statistically about twice as large as those based on F and R-factors based on ALL data will be even larger.

**Figure 1**

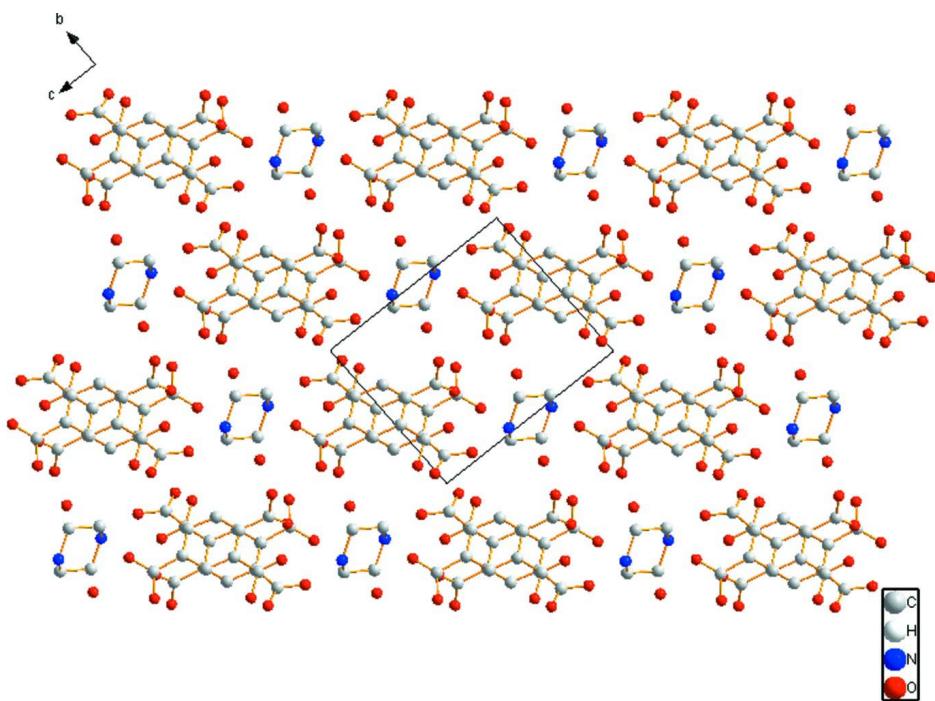

The view of the title compound showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level.

**Figure 2**

A perspective view of hydrogen bonding interactions represented by dashed lines. Inset: 2D supramolecular representation along *c* axis.

**Figure 3**

π-π stacking interactions between benzene-1,2,4,5-tetracarboxylates. Cations, water molecules and hydrogen atoms are omitted for clarity.

**Figure 4**

Crystal packing viewed along a axis. Hydrogen atoms are omitted for clarity.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
