Received 15 March 2013; accepted 21 March 2013

Key indicators: single-crystal X-ray study; $T = 173\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.058; wR factor = 0.120; data-to-parameter ratio = 17.1.

In the title compound, $\text{C}_{25}\text{H}_{18}\text{BClF}_2\text{N}_2\text{OS}$, the characteristic $\text{B}-\text{N}$ and $\text{B}-\text{O}$ bond lengths are $1.571(3)$ and $1.458(3)\text{ \AA}$, respectively. The phenyl rings form dihedral angles of $83.1(1)$ and $64.6(1)^\circ$ with the chlorophenyl ring. In the crystal, weak $\text{C}-\text{H}\cdots\text{N}$, $\text{C}-\text{H}\cdots\text{F}$, $\text{C}-\text{H}\cdots\pi$ and $\pi-\pi$ interactions [centroid–centroid distances $3.877(6)\text{ \AA}$ between the chlorophenyl rings of neighbouring molecules] held molecules together, forming ladders along the b axis.

S1. Comment

Thioacetanilides being novel enaminones (Peruncheralathan *et al.*, 2005) with four active reaction sites show structural feature of highly polarized push-pull interaction C=C double bond (Li *et al.*, 2010). BF₂ complexes, such as the Bodipy family, are most intriguing due to their outstanding optical properties, extraordinary chemical versatility, and variety of applications spanning from biolabeling (Wu *et al.*, 2009) to solar cells (Erten-Ela *et al.*, 2008) and nanoparticle engineering (Tokoro *et al.*, 2010). Synthetic studies have been conducted on various phosphorescent materials with heavy metals such as iridium (Tsuboyama *et al.*, 2003) and platinum (Lu *et al.*, 2002) and on fluorescent boron complexes (Zhang *et al.*, 2006). In order to explore the chemical reactivities of thioacetanilides, we obtained the title compound, (I).

In (I) (Fig. 1), the B1–N2 bond length (1.571 (3) Å) is more than 0.1 Å longer than the B1–O1 bond length (1.458 (3) Å) suggesting that the major resonance contribution to bonding is the alkoxy-imine form. All bond lengths and angles in (I) are normal and in a good agreement with those reported previously for related compounds (Macedo *et al.*, 2008) The phenyl rings C10—C15 and C20—C25 form the dihedral angles of 83.1 (1) and 64.6 (1)°, respectively, with the chlorophenyl ring C1—C6.

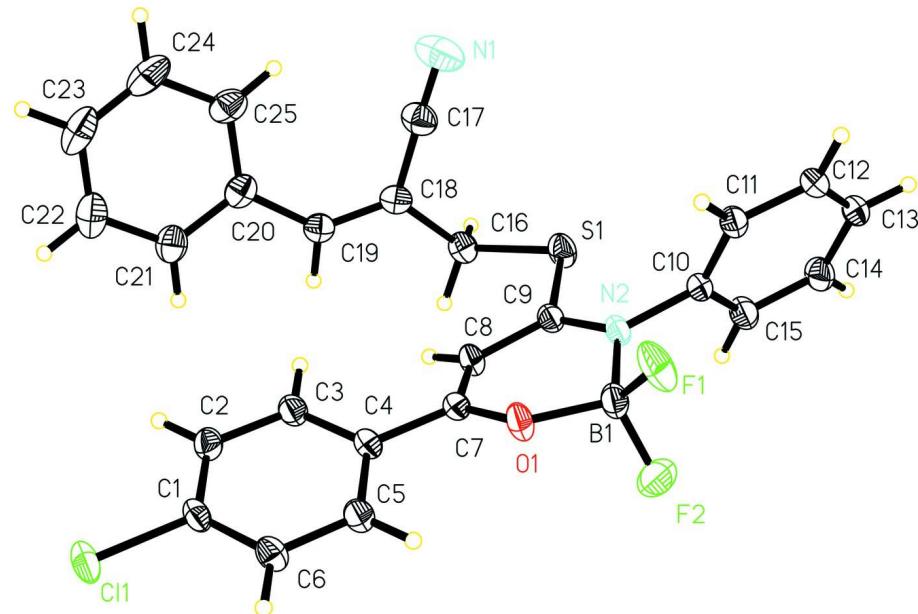

In the crystal, π - π interactions (centroid-to-centroid distances 3.877 (6) Å between the chlorophenyl rings of neighbouring molecules) and weak intermolecular C—H···N, C—H···F and C—H··· π interactions (Table 1) held molecules together.

S2. Experimental

A 25 ml volumetric flask was charged with 8 ml THF and 1.01 g (5 mmol) 2-cyano-1-phenylallyl acetate. Then 1.45 g (5 mmol) 3-(4-chlorophenyl)-3-oxo-N-phenylpropane thioamide and 0.09 g (3.75 mmol) sodium hydride were added. The mixture was stirred at room temperature for 4 h, and then 8 ml BF₃·Et₂O (10 mmol) was added with stirring for a further 4 h at room temperature. The reaction was monitored by TLC, and after TLC indicated the completion of the reaction, the solution was filtered, and the inorganic salts were removed. The solvent of the filtrate was removed with the aid of a rotary evaporator, and the residue was purified by column chromatography on silica gel, using petroleum ether/ethyl acetate (6:1) as eluent to provide the desired product yielding 2.01 g (84%) of pure BF₂ complex, m.p. 462–463 K. Analytical data: IR (KBr, cm⁻¹): 3080, 2977, 2180, 1681, 1583, 1505, 850, 732, 699. ¹H-NMR (500 MHz, CDCl₃): δ (p.p.m.) 3.98 (2H, s), 6.26 (1H, s), 7.22 (1H, s), 7.32–7.33 (2H, d, J = 7.55 Hz), 7.40–7.49 (8H, m), 7.73–7.74 (2H, d, J = 7.65 Hz), 7.88–7.90 (2H, d, J = 4.28 Hz). Single crystals suitable for X-ray diffraction were obtained through slow evaporation of a solution of the pure title compound in ethanol.

S3. Refinement

All H atoms were found on difference maps, but placed in idealized positions ($C-H = 0.95-0.99 \text{ \AA}$), and included in the final cycles of refinement using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg1 is the centroid of the C1—C6 ring.

D—H···A	D—H	H···A	D···A	D—H···A
C16—H16A···F1 ⁱ	0.99	2.35	3.184 (3)	141
