Received 8 March 2013; accepted 22 March 2013

Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{Sb}-\mathrm{S})=0.001 \AA$; $R$ factor $=0.018 ; w R$ factor $=0.042 ;$ data-to-parameter ratio $=23.2$.

The title quaternary compound, dibarium tetraantimony germanium decasulfide, $\mathrm{Ba}_{2} \mathrm{Sb}_{4} \mathrm{GeS}_{10}$, crystallizes in a novel three-dimensional ${ }_{\infty}^{3}\left[\mathrm{Sb}_{4} \mathrm{GeS}_{10}\right]^{4-}$ network structure, which is composed of triangular pyramidal $\mathrm{SbS}_{3}$ (site symmetry m..), distorted $\mathrm{SbS}_{5}$ ( $\left.m ..\right)$ polyhedra and regular $\mathrm{GeS}_{4}(\overline{4} .$.$) tetra-$ hedra. The $\mathrm{SbS}_{3}$ and $\mathrm{SbS}_{5}$ units are connected with each other through corner- and edge-sharing, forming a $\mathrm{Sb}_{4} \mathrm{~S}_{10}$ layer in the $a b$ plane. The $\mathrm{GeS}_{4}$ tetrahedra further bridge two neighbouring $\mathrm{Sb}_{4} \mathrm{~S}_{10}$ layers, forming a three-dimensional ${ }_{\infty}^{3}\left[\mathrm{Sb}_{4} \mathrm{GeS}_{10}\right]^{4-}$ network. The $\mathrm{Ba}^{2+}$ cation (.2) is located between two $\mathrm{Sb}_{4} \mathrm{~S}_{10}$ layers and is coordinated by ten S atoms with $\mathrm{Ba}-\mathrm{S}$ bond lengths in the range 3.2505 (9)-3.4121 (2) $\AA$.

## Related literature

The stereochemically active $5 s^{2}$ lone-pair electrons possess a large electric dipole moment and can influence structures that contain $\mathrm{Sb}^{3+}$, see: Choi \& Kanatzidis (2000); Babo \& Albrecht-Schmitt (2012). $\mathrm{SbS}_{3}, \mathrm{SbS}_{4}$ or $\mathrm{SbS}_{5}$ units in a crystal structure are prone to form $\mathrm{Sb}-\mathrm{S}$ chains through corner- or edge-sharing, see: Dorrscheidt \& Schäfer (1981); Cordier et al. (1984). $\mathrm{GeS}_{4}$ tetrahedra can be utilized as the second structural unit and introduced into crystal structures to connect $\mathrm{Sb}-\mathrm{S}$ chains into a two-dimensional layer or three-dimensional framework structure (Feng et al., 2008). For crystal structures and optical properties, see: Deng et al. (2005); Kim et al. (2008); Ribes et al. (1973); Teske (1979); Lekse et al. (2009).

## S1. Comment

Sb -based chalcogenides have attracted a lot of attention in recent years due to their rich structures and interesting physical properties, such as nonlinear optics and ion-exchange properties. The stereochemically active $5 \mathrm{~s}^{2}$ lone-pair electrons possess a large electric dipole moment and can influence structures that contain $\mathrm{Sb}^{3+}$ (Choi et al. 2000; Babo et al. 2012). $\mathrm{SbS}_{3}, \mathrm{SbS}_{4}$ or $\mathrm{SbS}_{5}$ units in a crystal structure are prone to form one-dimensional $\mathrm{Sb}-\mathrm{S}$ chains through a corner- or edge-sharing manner (Dorrscheidt et al. 1981; Cordier et al. 1984). GeS $4_{4}$ tetrahedron can be utilized as the second structural unit and introduced into crystal structure to connect $\mathrm{Sb}-\mathrm{S}$ chains into a two-dimensional layer or threedimensional framework structure (Feng et al. 2008). In this paper, a new title quaternary sulfide in the $\mathrm{Sb}-\mathrm{Ge}-\mathrm{S}$ system is dexcribed. $\mathrm{Ba}_{2} \mathrm{Sb}_{4} \mathrm{GeS}_{10}$ represents the first example of a structure synthesized and structurally characterized by single-crystal X-ray diffraction in the quaternary $\mathrm{Ba}-\mathrm{Sb}-\mathrm{Ge}-\mathrm{S}$ system (Fig. 1). It crystallizes with one Ge atom on $4 b$ and three S atoms on $8 h, 16 i$ and $16 i$, respectively, in terms of the Wyckoff notation. There are two types of coordination polyhedron of SbS groups, i.e. triangle-pyramidal $\mathrm{SbS}_{3}$ and distorted $\mathrm{SbS}_{5}$ polyhedra. $\mathrm{SbS}_{3}$ and $\mathrm{SbS}_{5}$ polyhedra are connected with each other through corner- and edge-sharing conformations to form $\mathrm{Sb}_{4} \mathrm{~S}_{10}$ zigzag chains, which are further arranged side by side into the $\mathrm{Sb}_{4} \mathrm{~S}_{10}$ layer in the $a b$-plane (Fig. 2). The $\mathrm{GeS}_{4}$ tetrahedra further bridge two neighbouring $\mathrm{Sb}_{4} \mathrm{~S}_{10}$ layers, forming athree-dimensional $\infty^{3}\left[\mathrm{Sb}_{4} \mathrm{GeS}_{10}\right]^{-4}$ network (Fig. 3). The Ba atom is located between two $\mathrm{Sb}_{4} \mathrm{~S}_{10}$ layers and coordinates with ten S atoms with $\mathrm{Ba}-\mathrm{S}$ bonding lengths in the range of 3.2505 (9)-3.4121 (2) $\AA$, which are typical values for sulfides (Dorrscheidt et al. 1981; Cordier et al. 1984).

## S2. Experimental

The title compound, $\mathrm{Ba}_{2} \mathrm{Sb}_{4} \mathrm{GeS}_{10}$, was synthesized through a high temperature solid-state reaction in an evacuated and sealed silica tube. A mixture of $\mathrm{BaS}(0.5 \mathrm{mmol}, 0.0847 \mathrm{~g}), \mathrm{Sb}(1 \mathrm{mmol}, 0.1218 \mathrm{~g}), \mathrm{Ge}(0.25 \mathrm{mmol}, 0.0182 \mathrm{~g}), \mathrm{S}(2 \mathrm{mmol}$, 0.0641 g ) was loaded in a silica ampoule, sealed under $10^{-2} \mathrm{~Pa}$, heated gradually to 1173 K (holding for 10 h ) in 60 h , and then cooled to room temperature in 300 h . Rod-shaped crystals of $\mathrm{Ba}_{2} \mathrm{Sb}_{4} \mathrm{GeS}_{10}$ with a dark red color were obtained. The crystals were stable under air and moisture conditions.

## S3. Refinement

All atoms in $\mathrm{Ba}_{2} \mathrm{Sb}_{4} \mathrm{GeS}_{10}$ crystal structure were refined anisotropically without disorder. The highest residual peak ( 0.66 $\mathrm{e} \times \AA^{-3}$ ) in the difference electron density map was located at $(0.1992,0.3008,1 / 4), 1.09 \AA$ from atom Ba 1 . The deepest hole $\left(-0.73 \mathrm{e} \times \AA^{-3}\right)$ was located at $(0.1670,0.7496,0.2499), 0.77 \AA$ from atom Ba1.

Figure 1
Crystal structure of $\mathrm{Ba}_{2} \mathrm{Sb}_{4} \mathrm{GeS}_{10}$ in $\mathrm{GeS}_{4}$ polyhedral representation viewed along [001]. Green tetrahedra represent the $\mathrm{GeS}_{4}$ unit with yellow sulfur atoms at the corners of each tetrahedron.

Figure 2
$\mathrm{SbS}_{3}$ and $\mathrm{SbS}_{5}$ polyhedra are connected with each other through corner- and edge-sharing conformations to form the $\mathrm{Sb}_{4} \mathrm{~S}_{10}$ zigzag chains, which are further arranged side by side into the $\mathrm{Sb}_{4} \mathrm{~S}_{10}$ layer in the $a b$-plane.

Figure 3
The novel three-dimensional $\infty^{3}\left[\mathrm{Sb}_{4} \mathrm{GeS}_{10}\right]^{-4}$ network viewed along [100] direction. $\mathrm{GeS}_{4}$ tetrahedra act as bridging units for two neighbouring $\mathrm{Sb}_{4} \mathrm{~S}_{10}$ layers.

Secondary atom site location: difference Fourier
map
$w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.0214 P)^{2}+3.2912 P\right]$
where $P=\left(F_{0}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}<0.001$
$\Delta \rho_{\text {max }}=0.66$ e $\AA^{-3}$
$\Delta \rho_{\text {min }}=-0.74 \mathrm{e} \AA^{-3}$
Extinction correction: SHELXL97 (Sheldrick, 2008), $\mathrm{Fc}^{*}=\mathrm{kFc}\left[1+0.001 \mathrm{xFc}^{2} \lambda^{3} / \sin (2 \theta)\right]^{-1 / 4}$

Extinction coefficient: 0.00225 (8)

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
