Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.061;  $wR$  factor = 0.197; data-to-parameter ratio = 17.8.

The title compound,  $C_{25}H_{19}\text{N}$ , adopts an *E* conformation about the  $\text{C}=\text{N}$  bond. The naphthalene ring system and the phenyl rings form dihedral angles 38.1 (1), 46.9 (8) and 48.5 (1) $^\circ$ , respectively, with the mean plane of the central enimino fragment. The crystal packing exhibits no directional close contacts.

## (*E*)-*N*-(3,3-Diphenylallylidene)naphthalen-1-amine

Jae Kyun Lee, Kee Dal Nam, Joo Hwan Cha, Yong Seo Cho and Joon Kyun Lee

### S1. Comment

As a part of our ongoing study of 2-phenylcinnamaldehyde derivatives containing aniline (Cha *et al.*, 2012; Kang *et al.*, 2012; Yu *et al.*, 2013) and naphthylamine (Nam *et al.*, 2013), we present here the title compound.

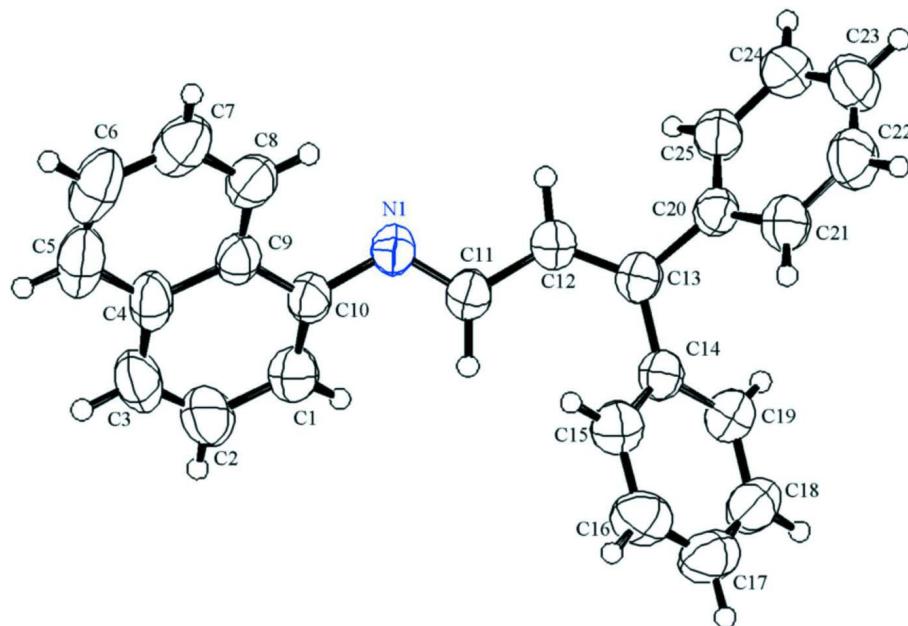

The title compound (Fig. 1) adopts an (*E*) conformation about the C=N bond. The naphthalene bicyclic C1–C10 and phenyl rings C14–C19 and C20–C25 form the dihedral angles 38.1 (1), 46.9 (8) and 48.5 (1)°, respectively, with the mean plane of the central N1–C11–C12 enimino fragment. The crystal packing exhibits no classical intermolecular contacts.

### S2. Experimental

In a solution of 1-naphthylamine (2.0 mmol) in anhydrous ethanol (50 mL) was treated with equimolar quantities of substituted 2-phenylcinnamaldehydes. The mixture was refluxed for 2 days, and the progress of reaction was monitored by TLC. After completion of reaction, the solvent was removed under reduced pressure. The residue was purified by flash column chromatography to afford the title compound as a yellow solid in yield 92%. Single crystals suitable for X-ray diffraction were prepared by slow evaporation of a solution of the title compound in ethanol at room temperature.

### S3. Refinement

All hydrogen atoms were positioned geometrically (C—H = 0.93 Å), and refined using a riding model, with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ .

#### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor  $wR$  and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
