Received 25 June 2013; accepted 25 June 2013

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.058; wR factor = 0.124; data-to-parameter ratio = 17.3.

Two independent molecules with quite similar conformations, *A* and *B*, comprise the asymmetric unit of the title compound, $\text{C}_{23}\text{H}_{21}\text{N}_3\text{O}_2\text{S}$. The terminal amide substituent is coplanar with the attached benzene ring [the $\text{O}-\text{C}-\text{C}-\text{C}$ torsion angles are $174.0(2)$ (*A*) and $6.3(3)^\circ$ (*B*)]. In the same way, the central amide group [$\text{C}-\text{C}-\text{C}-\text{O} = 7.8(3)$ (*A*) and $11.5(3)^\circ$ (*B*)] is approximately coplanar with the ring to which it is attached. A major twist is noted between the amide and adjacent thioamide residues [$\text{C}-\text{N}-\text{C}-\text{S} = -109.29(19)$ (*A*) and $-112.29(19)^\circ$ (*B*)]. In the crystal, supramolecular chains along [100] are formed by $\text{N}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{S}$ hydrogen bonding. These are connected into a three-dimensional architecture by $\text{C}-\text{H}\cdots\pi$ and $\pi-\pi$ interactions [inter-centroid distance = $3.9157(12)\text{ \AA}$].

3-{{(Dibenzylcarbamothioyl)amino]carbonyl}benzamide}

N. Selvakumaran, R. Karvembu, Seik Weng Ng and Edward R. T. Tiekink

S1. Comment

In an attempt to prepare a bipodal acylthiourea derivative (Bourne *et al.*, 2005) from dibenzylamine, isophthaloyl dichloride and potassium thiocyanate in acetone, the title compound, (I), was obtained as a by-product.

Two independent but similar molecules comprise the asymmetric unit in (I), Fig. 1. In each case, the terminal amide substituent is co-planar with the attached benzene ring as seen in the O1—C1—C2—C3 and O3—C24—C25—C30 torsion angles of 174.0 (2) and 6.3 (3) $^{\circ}$, respectively. Similarly, the central amide [C5—C6—C8—O2 = 7.8 (3) $^{\circ}$ and C28—C29—C31—O4 = 11.5 (3) $^{\circ}$] is approximately co-planar with the ring to which it is attached. It is in this region of the molecule that the major differences occur although minimal, Fig. 2. A major twist is noted between the amide and adjacent thioamide residues as seen in the torsion angles: C8—N2—C9—S1 = -109.29 (19) $^{\circ}$ and C31—N5—C32—S2 = -112.29 (19) $^{\circ}$. The benzyl substituents lie to either side and are approximately perpendicular to the C₃N plane with the C9—N3—C10—C11 and C9—N3—C17—C18 torsion angles being 98.2 (2) and 95.8 (2) $^{\circ}$, respectively, for the first independent molecule. For the second independent molecule, the C32—N6—C33—C34 torsion angle is 100.5 (2) $^{\circ}$ and the C32—N6—C40—C41 angle is 96.9 (2) $^{\circ}$. To a first approximation, the observed conformation matches that reported in the accompanying paper (Selvakumaran *et al.*, 2013).

In the crystal packing, supramolecular chains along the *a* axis are formed by N—O and N—H···S hydrogen bonds, Fig. 3 and Table 1. These are connected into layers by C—H··· π interactions, Table 1. A three-dimensional architecture is formed *via* π — π interactions between centrosymmetrically related benzene rings [inter-centroid distance = 3.9157 (12) Å for symmetry operation 1-*x*, 1 - *y*, 1 - *z*], Fig. 4.

S2. Experimental

Isophthaloyl dichloride (2.0302 g, 10 mmol) dissolved in acetone (80 ml), was placed in a dropping funnel and added drop wise with stirring to potassium thiocyanate (1.9436 g, 20 mmol) dissolved in acetone (80 ml), under N₂ atmosphere, in a three-necked round bottom flask. The mixture was heated to reflux for 30 minutes and then allowed to cool. A solution of dibenzylamine (3.9456 g, 20 mmol) in acetone (80 ml) was added drop wise from a dropping funnel to the reaction mixture and the resulting mixture was stirred for 2 h at room temperature. Then, hydrochloric acid (0.1 N, 300 ml) was added and the resulting white solid was filtered off, washed with water and dried *in vacuo*. Single crystals were grown at room temperature from acetonitrile/dimethyl formamide mixture (1:1). FT—IR (KBr): ν (NH₂) 3290 & 3225, ν (N—H) 3426, ν (C=O) 1674 (adjacent to NH₂), ν (C=O) 1660 (adjacent to NH), ν (C=C) 1599, ν (C=S) 1257 cm⁻¹. UV-Vis (DMF): λ_{max} ; 267, 281, 359 nm.

S3. Refinement

Carbon-bound H-atoms were placed in calculated positions [C—H = 0.95 to 0.98 Å, $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$] and were included in the refinement in the riding model approximation. The N-bound H-atoms were refined with N—H =

$0.88 \pm 0.01 \text{ \AA}$, and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$. A reflection, *i.e.* (0 1 2), was omitted owing to poor agreement.

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg1—Cg3 are the centroids of the C25—C30, C34—C39 and C11—C16 benzene rings, respectively.
