Received 25 May 2013; accepted 20 June 2013

Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.020 \AA$; $R$ factor $=0.047 ; \omega R$ factor $=0.164 ;$ data-to-parameter ratio $=12.0$.

In the title compound, $\left[\mathrm{Cd}\left(\mathrm{C}_{4} \mathrm{H}_{5} \mathrm{NO}_{4}\right)\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]_{n}$, the $\mathrm{Cd}^{\mathrm{II}}$ atom exhibits a distorted octahedral coordination geometry, defined by one N atom and three O atoms from two iminodiacetate (IDA) ligands and two water molecules. The tridentate IDA ligand additionally bridges via one of its carboxylate O atoms to another $\mathrm{Cd}^{\mathrm{II}}$ atom, thus forming a zigzag chain along [001]. A three-dimensional network is completed by intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds.

## S1. Comment

$\mathrm{Cd}(\mathrm{II})$ ion with $\mathrm{d}^{10}$ electronic configuration exhibits a wide variety of coordination geometries and modes, which can induce versatile structural topologies (Brusau et al., 2001). A large number of metal-organic compounds based on $\mathrm{Cd}(\mathrm{II})$ have been reported. However, to the best of our knowledge, only the structure of a $\mathrm{Cd}(\mathrm{II})$ complex with benzimidazole and iminodiacetate (IDA) ligands has been reported so far ( $\mathrm{Su} \& \mathrm{Xu}, 2005$ ). We report here the structure of a Cd (II) iminodiacetate coordination polymer.
In the title complex (Fig. 1), the $\mathrm{Cd}^{\text {II }}$ atom exhibits a distorted octahedral coordination geometry defined by one N atom and two atoms from an IDA ligand, one O atom from another IDA and two water molecules. The five membered chelating ring generated by $\mathrm{O} 1-\mathrm{C} 1-\mathrm{C} 2-\mathrm{N} 1-\mathrm{Cd} 1$ is nearly planar, with a largest deviation of -0.093 (16) from C 2 to the mean plane, while the $\mathrm{O} 4-\mathrm{C} 4-\mathrm{C} 3-\mathrm{N} 1-\mathrm{Cd} 1$ chelating ring shows largest deviations of -0.440 (16) for C 3 and 0.304 (11) for N 1 in the opposite directions from the mean plane. The dihedral angle between the two chelating ring planes is $82.4(3)^{\circ}$. The bond distances of $\mathrm{Cd}-\mathrm{O}$ and $\mathrm{Cd}-\mathrm{N}$ are comparable to those in [(benzimidazole) $)_{3}(\mathrm{IDA}) \mathrm{Cd} .2 \mathrm{H}_{2} \mathrm{O}$ ] (Su \& Xu, 2005). However, these bond distances are $0.06-0.19 \AA$ longer than the values in a reported $\mathrm{Mn}(\mathrm{II})$ analogs (Zhang \& Lu , 2004). The IDA ligand bridges two $\mathrm{Cd}^{\mathrm{II}}$ atoms, forming a zigzag chain along [001] (Fig. 2). A three-dimensional network is completed by intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Fig. 3).

## S2. Experimental

A mixture of iminodiacetic acid ( $0.067 \mathrm{~g}, 0.5 \mathrm{mmol}), \mathrm{CdSO}_{4} .8 \mathrm{H}_{2} \mathrm{O}(0.208 \mathrm{~g}, 1 \mathrm{mmol}), \mathrm{NaOH}(0.040 \mathrm{~g}, 1 \mathrm{mmol})$ and water ( 15 ml ) was sealed in a Teflon-lined stainless steel vessel $\left(25 \mathrm{~cm}^{3}\right)$, and then the vessel was heated at 403 K for 3 days. After the mixture was slowly cooled to room temperature, colorless block-shaped crystals of the title compound were obtained. Analysis, calculated for $\mathrm{C}_{4} \mathrm{H}_{9} \mathrm{CdNO}_{6}$ : C 17.19 , H 3.25, N $5.01 \%$; found: C 17.16 , H 3.33, N 5.08\%.

## S3. Refinement

H atoms bonded to C and N atoms were positioned geometrically and refined as riding atoms, with $\mathrm{C}-\mathrm{H}=0.97$ and $\mathrm{N}-$ $\mathrm{H}=0.91 \AA$ and with $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C}, \mathrm{N}) . \mathrm{H}$ atoms of water molecules were located in a difference Fourier map and refined as riding, with $\mathrm{O}-\mathrm{H}=0.85 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{O})$. The maximum remaining electron density is found $1.13 \AA$ from Cd 1 and the minimum density $1.43 \AA$ from O 2 .

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.047$
$w R\left(F^{2}\right)=0.164$
$S=1.09$
1303 reflections
109 parameters
1 restraint
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map

> Hydrogen site location: inferred from $\quad$ neighbouring sites
> H -atom parameters constrained
> $w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}^{2}\right)+(0.0941 P)^{2}+9.9695 P\right]$
> $\quad$ where $P=\left(F_{\mathrm{o}}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
> $(\Delta / \sigma)_{\max }<0.001$
> $\Delta \rho_{\max }=2.05 \mathrm{e} \AA^{-3}$
> $\Delta \rho_{\min }=-1.23 \mathrm{e} \AA^{-3}$
> Absolute structure: Flack (1983), 566 Friedel $\quad$ pairs

Absolute structure parameter: 0.04 (14)

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R -factor wR and goodness of fit S are based on $\mathrm{F}^{2}$, conventional R-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger.
