Received 4 May 2013; accepted 27 May 2013

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.042;  $wR$  factor = 0.119; data-to-parameter ratio = 12.8.

The title compound,  $\text{C}_{16}\text{H}_{15}\text{ClN}_2\text{O}_4$ , contains a chiral centre and crystallizes as a racemate. The methylene group  $\beta$ -positioned to the carbonyl group is partially (21%) disordered. It flips to the opposite sides of the corresponding six-membered carbocycle by  $-0.304(3)$  and  $0.197(11)\text{ \AA}$ , producing alternative envelope conformations. The planes of the pyran and chlorophenyl rings form a dihedral angle of  $86.25(9)^\circ$ . The molecular structure is characterized by an intramolecular  $\text{N}-\text{H}\cdots\text{O}$  interaction, which generates an  $S(6)$  ring motif. The corresponding amino N atom deviates from the plane of the pyran ring by  $0.1634(19)\text{ \AA}$ . In the crystal, molecules are linked via  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds, forming  $C(8)$  chains running parallel to the  $b$ -axis direction. The crystal structure also features  $\text{C}-\text{H}\cdots\pi$  interactions.

### S1. Comment

Chromene derivatives are very important heterocyclic compounds that have a variety of industrial, biological and chemical synthesis applications (Geen *et al.*, 1996; Ercole *et al.*, 2009). They exhibit a number of pharmacological activities such as anti-HIV, anti-inflammatory, anti-bacterial, anti-allergic, anti-cancer *etc.* (Khan *et al.*, 2010, Raj *et al.*, 2010). Against this background, X-ray analysis of the title compound has been carried out to study its structural aspects.

X-ray analysis confirms the molecular structure and atom connectivity. The molecular structure is stabilized by intramolecular N2—H2A···O3 interaction, which generates S(6) ring motif as illustrated in Fig. 1. The methylene group carbon atom C11 of the chromene moiety is disordered over two positions, with an occupancy factor of 0.787 (5):0.213 (5). The pyrane ring (C7/C8/C13/C14/C15/O1) is almost orthogonal to the chlorophenyl ring (C1–C6), with a dihedral angle of 86.25 (9)° between their mean planes.

The pyrane ring is almost coplanar with the least-square planes of the nitro and methylene groups, making dihedral angles of 5.19 (14) and 5.01 (16)°, with them, respectively.

The six-membered carbocyclic rings (C8/C9/C10/C11/C12/C13) and (C8/C9/C10/C11'/C12/C13) of the chromene moiety adopt envelope conformations on the atoms C11 and C11', with puckering parameters:  $Q_2 = 0.366$  (3) Å,  $Q_3 = 0.229$  (3) Å and  $\varphi_2 = 178.1$  (2)°, and  $Q_2 = 0.211$  (7) Å,  $Q_3 = -0.185$  (5) Å and  $\varphi_2 = 3.1$  (2)°, respectively. Also, the atoms C11 and C11' deviate from their respective mean planes of the rest of the ring atoms by -0.304 (3) and 0.197 (11) Å, respectively. The amine group nitrogen atom N2 deviates by 0.1634 (19) Å from the mean plane of the pyran ring. The chlorine atom Cl1 deviates from the phenyl ring (C1–C6) by 0.0571 (9) Å. The title compound exhibits structural similarities with an already reported related structure (Sun *et al.*, 2012).

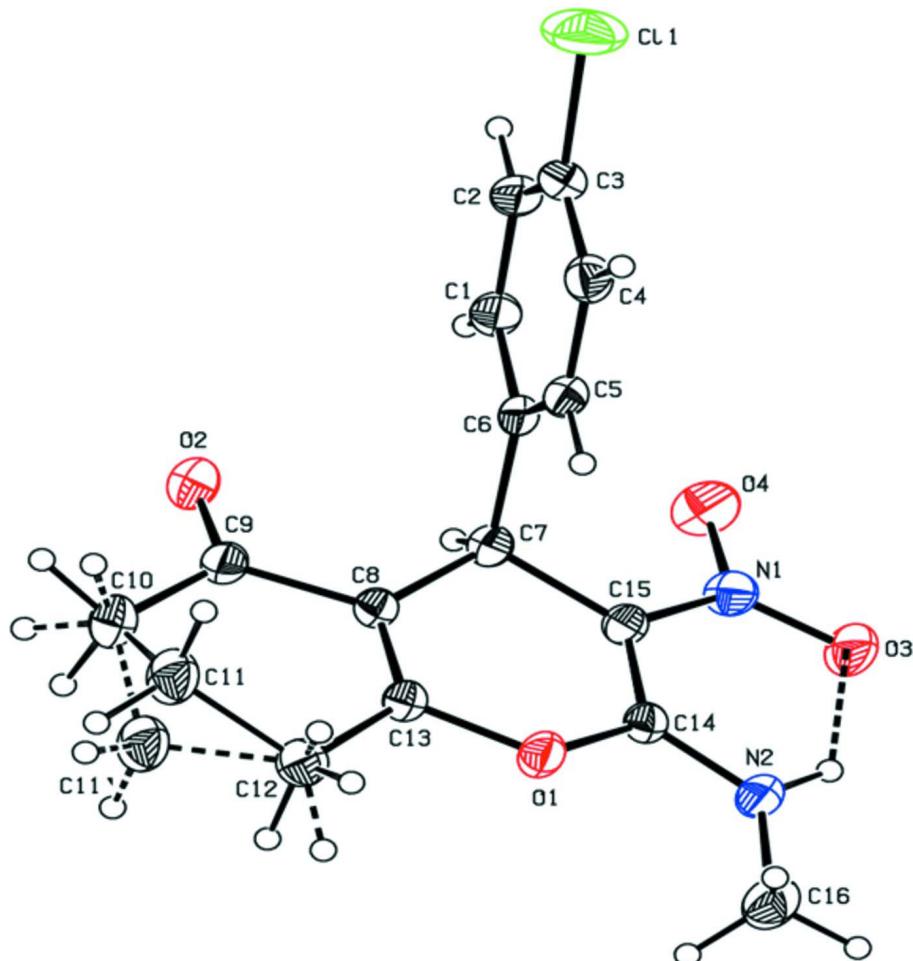

In the crystal, the molecules are linked *via* intermolecular C2—H2···O4<sup>i</sup> hydrogen-bond interaction, which generates C(8) chains running parallel to *b* axis (Bernstein *et al.*, 1995). The crystal structure is further stabilized by C10—H10A···Cg1<sup>ii</sup> and C16—H16B···Cg1<sup>iii</sup> intermolecular interactions, where Cg1 is the center of gravity of the pyran ring (C7/C8/C13/O1/C14/C15). The symmetry codes: (i) 3/2 - *x*, 1/2 + *y*, 1/2 - *z* (ii) 2 - *x*, 2 - *y*, -*z* (iii) 1 - *x*, 1 - *y*, -*z*. The packing view of the title compound is shown in Fig. 2.

### S2. Experimental

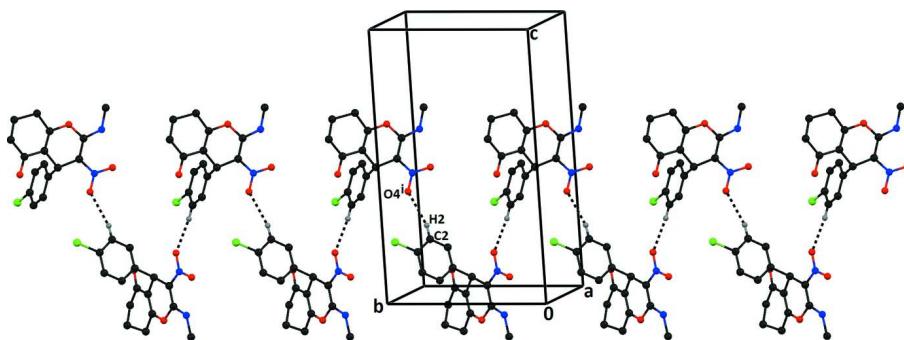

A solution of 4-chlorobenzaldehyde (0.14 g, 1.0 mmol), cyclic 1,3-dicarbonyl compound (1.0 mmol), NMSM (0.15 g, 1.0 mmol) and piperidine (0.2 equivalents) in EtOH (2 ml) was stirred for 3.5 h. After the reaction was complete as indicated by TLC, the product was filtered and washed with EtOH (2 ml) to remove the excess base and other impurities. Single crystals suitable for X-ray diffraction were prepared by slow evaporation of a solution of the title compound in ethanol at room temperature.

**S3. Refinement**

Positions of the H atoms were localized from the difference electron-density maps and their distances were geometrically constrained. The H atoms of the amine group were constrained to distances of N—H = 0.901 (10) Å with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$ . The H atoms bound to the C atoms were treated as riding atoms, with C—H = 0.93 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  for aromatic, C—H = 0.97 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  for methelene, C—H = 0.98 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  for methiene, and C—H = 0.96 Å and  $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{C})$  for methyl groups. The rotation angles for methyl groups were optimized by least squares. The bond distances of the disordered components were restrained using standard similarity restraint SADI (*SHELXL97*; Sheldrick, 2008) with an s.u. of 0.01 Å. The atomic displacement parameters of the major and minor components were made similar using the constraint EADP.

**Figure 1**

The molecular structure of the title compound, with the atom-numbering scheme. The intramolecular hydrogen bond is shown. The displacement ellipsoids are drawn at 30% probability level. H atoms are shown as spheres of arbitrary radius.

**Figure 2**

The crystal packing of the title compound, viewed along  $c$  axis, showing C2—H2 $\cdots$ O4<sup>i</sup> hydrogen bonds producing  $C(8)$  chains parallel to  $b$  axis. H atoms not involved in the hydrogen bonding have been excluded for clarity. The symmetry code: (i)  $3/2 - x, 1/2 + y, 1/2 - z$ .

 $\Delta\rho_{\min} = -0.28 \text{ e } \text{\AA}^{-3}$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
