## 4-(4-Nitrobenzyl)pyridine

Deeb Taher, Firas F. Awwadi and Mohammed H. Kailani*

Department of Chemistry, The University of Jordan, Amman 11942, Jordan
Correspondence e-mail: kailani@ju.edu.jo
Received 27 May 2013; accepted 20 June 2013
Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.047 ; \omega R$ factor $=0.106$; data-to-parameter ratio $=14.7$.

The title compound, $\mathrm{C}_{12} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O}_{2}$, has a twisted conformation, with a dihedral angle between the planes of the pyridine and benzene rings of $78.4(2)^{\circ}$. The nitro group is coplanar with the attached benzene ring within experimental error. The molecules form centrosymmetric dimers via $\mathrm{C}_{\mathrm{ar}}-\mathrm{H} \cdots \mathrm{O}$ interactions $(\mathrm{H} \cdots \mathrm{O}=2.49 \AA)$ and the dimers are $\pi$-stacked along the $b$ axis [the separation between ring centroids is 3.788 (2) Å].

## Related literature

## 4-(4-Nitrobenzyl)pyridine

Deeb Taher, Firas F. Awwadi and Mohammed H. Kailani

## S1. Comment

X-Ray structure of the title compound was never reported before in its non-coordinated form, even though several works have been published on it's pyridiunium salts/adducts. The adducts with carboxilic acids were reported for 4-aminobenzoic (Smith et al., 1997) and 5-nitrosalicylic acid (Smith \& Wermuth, 2010). Recently, a structure of an adduct with 3-carboxy-4-hydroxybenzenesulfonic acid was also determined (Smith \& Wermuth, 2013). The structures of the adducts are dominated by $N$ (pyridine)—H $\cdots \mathrm{O}$ hydrogen bonding interactions. In addition, X-ray structure of a zinc complex of the title compound (Diiodidobis[4-(4-nitrobenzyl)pyridine- ${ }_{\kappa} \mathrm{N}^{1}$ ]zinc) has also been determined (Smith et al., 2011).
The title compound (Fig. 1) gives colorless crystals. The angle between the planes of benzene and pyridine rings is $78.43^{\circ}$ and the nitro group is coplanar with the benzene ring. The two aromatic planes are twisted relative to each other, which result in reduction of molecular symmetry from $\mathrm{C}_{\mathrm{s}}$ to $\mathrm{C}_{1}$ : the dihedral angle $\mathrm{C} 2-\mathrm{C} 3 \cdots \mathrm{C} 7-\mathrm{C} 8$ is $30.5(2)^{\circ}$. Two molecular units of the title compound inter-associate through duplex $\mathrm{C} 9-\mathrm{H} \cdots \mathrm{O} 2$ hydrogen bonds to form a cyclic dimer (Fig. 2 and Table 1). Then, these dimers are stacked via $\pi \cdots \pi$ interactions between benzene rings to form ribbon structure extending parallel to $b$-axis (Fig. 3); the angle between the two planes, centroid-centroid distance and shift distance are $0^{\circ}, 3.788 \AA$ and $1.613 \AA$, respectively, as determined by Olex2 program package (Dolomanov et al., 2009). Subsequently, these ribbons are interdigitated to form the final three-dimensional structure (Fig. 4).
The nitro group of the title compound, was found to be a major factor in determining the interactions in the crystal form, unlike in the previously published structures where the pyridinic nitrogen was the main driving force for amolecular association.

## S2. Experimental

Crystals of the title compound were obtained by dissolving 1 mmol of 4-(4-nitrobenzyl) pyridine in 30 ml of hot $96 \%$ ethanol. Partial evaporation of the hot-filtered solution at room temperature yielded colourless crystals from which a block section was cleaved for the X-ray analysis.

## S3. Refinement

The structure was solved by direct methods and refined by least squares method on F2 using the SHELXTL program package. All atoms were refined anisotropically. Hydrogen atoms were placed at the calculated positions using a riding model with $\mathrm{C}($ aromatic $)-\mathrm{H}=0.95 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 \mathrm{Ueq}(\mathrm{C})$, and with $\mathrm{C}($ aliphatic $) — \mathrm{H}=0.98 \AA$ and $U_{\text {iso }}(\mathrm{H})=$ $1.5 \mathrm{Ueq}(\mathrm{C})$. refinement details)

$\Delta \rho_{\min }=-0.15 \mathrm{e}^{-3}$

## Special details

Experimental. Absorption correction CrysAlis PRO (Agilent, 2011). Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
