## 1,3-Bis(chloromethyl)benzene

Marisa B. Sanders, David Leon, Eddy I. Ndichie and Benny C. Chan*

Department of Chemistry, The College of New Jersey, 2000 Pennington Rd, Ewing, NJ 08628, USA
Correspondence e-mail: chan@tcnj.edu
Received 5 March 2013; accepted 12 June 2013
Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.023 ; w R$ factor $=0.064$; data-to-parameter ratio $=21.4$.

The title compound, $\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{Cl}_{2}$, used in the synthesis of many pharmaceutical intermediates, forms a three-dimensional network through chlorine-chlorine interactions in the solidstate that measure 3.513 (1) and 3.768 (3) $\AA$.

## Related literature

For background information on the applications of halogenated xylenes, see: Ito \& Tada (2009); Zordan \& Brammer (2006). For related structures, see: Castaner et al. (1991). For halogen-halogen interactions, see: Hathwar et al. (2010). For additional information on how the space group of the structure was solved, see Spek (2009).

## 1,3-Bis(chloromethyl)benzene

Marisa B. Sanders, David Leon, Eddy I. Ndichie and Benny C. Chan

## S1. Comment

Halogenated xylenes, including the title compound, have a variety of applications in agrochemicals, drugs, and macromolecular materials (Ito and Tada, 2009). Most recently, these compounds have shown potential for their use in hard-coated film for optical devices (Ito and Tada, 2009). Compounds such as the title one that contain networks of halogen-halogen contacts also have a variety of applications in liquid crystals, topochemical reactions, conducting materials, and anion receptors (Zordan and Brammer, 2006). 1,3-Bis(chloromethyl)benzene is stabilized by chlorinechlorine interactions of 3.513 (1) $\AA$ and 3.768 (3) $\AA$. These contacts are within the normal range of chlorine-chlorine interactions, which are typically $3.546 \AA$ to $3.813 \AA$ (Hathwar et al., 2010).

## S2. Experimental

Approximately 100 mg of the title compound was dissolved in 2 ml of hexanes. The solution was evaporated slowly over one week to produce large, clear, block crystals.

## S3. Refinement

The structure was solved using direct methods (Bruker, 2011).

Figure 1
Thermal ellipsoid plot at $50 \%$ probability.

Figure 2
The title structure is stabilized by chlorine-chlorine interactions that measure 3.513 (1) $\AA$ and 3.768 (3) $\AA$ to form a three dimensional network. Carbon atoms are shown in black, hydrogen atoms in pink, and chlorine atoms in green.

$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}^{2}\right)+(0.0356 P)^{2}+0.6168 P\right]$ where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}=0.001$
$\Delta \rho_{\text {max }}=0.39 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\text {min }}=-0.24 \mathrm{e} \AA^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
