Received 9 March 2013; accepted 10 July 2013

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.042; wR factor = 0.125; data-to-parameter ratio = 13.5.

The title compound, $C_{23}H_{21}ClN_4$, contains two molecules (*A* and *B*) in the asymmetric unit, which are related to one another by a pseudo-inversion center. The non-aromatic pyrrolidine ring in each independent molecule adopts a half-chair conformation; the ring puckering parameters are $\theta = 0.407(3)\text{ \AA}$ and $\varphi = 270.5(4)^\circ$, and the pseudo-rotation parameters are $\rho = 72.5(3)^\circ$ and $\tau = 42.2(2)^\circ$ for an $\text{N}-\text{C}$ bond of molecule *A*, and the corresponding values are $0.415(3)\text{ \AA}$, $271.6(4)^\circ$, $73.6(3)^\circ$ and $42.6(2)^\circ$ for molecule *B*. The dihedral angles between the central fused-ring system and the substituted chlorophenyl and methylphenyl rings are 66.35 and 45.59° , respectively, for molecule *A*, and 64.51 and 41.89° for molecule *B*. The geometry of all four intramolecular $\text{C}-\text{H}\cdots\pi$ interactions are of type III. $\pi-\pi$ interactions involving the centroids of symmetry-related pyrrole rings of molecule *B* are 4.390 \AA , contributing further to the stability of the molecule.

5-(4-Chlorophenyl)-7-(4-methylphenyl)-4-(pyrrolidin-1-yl)-7*H*-pyrrolo[2,3-*d*]pyrimidine

Urmila H. Patel, Rajesh D. Modh and Dhaval A. Shah

S1. Comment

Pyrrolo[2,3-*d*]pyrimidine belongs to an important class of biologically active heterocyclic compounds, structurally closely related to nucleosides and some antibiotics (Chadwick, 1990; Ohgi *et al.*, 1979). These group of compounds are very well recognized for their biological activities such as anti-tumor, anti-allergic, anti-viral and anti-inflammatory (Hulzenlaub *et al.*, 1972; Smith *et al.*, 1972). As a part of a continuation of our crystallographic investigations of heterocyclic compounds (Patel *et al.*, 2007; Patel *et al.*, 2012), we now report herein the supra-molecular structure of a fused pyrrolo[2,3-*d*]pyrimidine derivative.

Two independent molecules A and B of the asymmetric unit [Fig.1] have similar conformations. The fused pyrrolo pyrimidine rings of A and B in the title compound are practically planar with a dihedral angle of 4.11 (16) $^{\circ}$ in A and 3.00 (17) $^{\circ}$ in B. The observed bond lengths and bond angles indicate a significant amount of strain arising due to fusion. A close observation of the molecular geometry: bond lengths, bond angles including torsional angles of both molecules A and B reveals that two independent molecules of the asymmetric unit are related to each other by a pseudoinversion center. The aromatic pyrrolidine ring of both molecules is puckered to adopt half chair conformation. The ring puckering parameters for mol A corresponding to the atom sequence N24—C25—C26—C27—C28 (Cremer *et al.*, 1975) are Theta = 0.407 (3) $^{\circ}$ and Phi = 270.5 (4) $^{\circ}$ and pseudo rotation parameters are Rho = 72.5 (3) $^{\circ}$ and t = 42.2 (2) $^{\circ}$ for N24—C25 bond and those of molecule B are Theta = 0.415 (3) $^{\circ}$ and Phi = 271.6 (4) $^{\circ}$ for the atom sequence N52—C53—C54—C55—C56 and the pseudo rotation parameters Rho = 73.6 (3) $^{\circ}$ and t = 42.6 (2) $^{\circ}$ for N52—C53 bond confirming a half chair conformation. The conformation of the substituents chlorophenyl, methylphenyl and pyrrolidine of both molecules are very similar. Torsional angles C4—C5—N24—C28 (177.9 (3) $^{\circ}$) and C32—C33—N52—C53 (177.9 (3) $^{\circ}$) confirm an extended conformation of the pyrrolidine ring with respect to fused ring system where as chlorophenyl ring of both molecules indicates a maximum turn, with dihedral angle of 66.35 $^{\circ}$ (A) and 64.51 $^{\circ}$ (B) between the said ring and fused system. The tolyl ring of both molecules are twisted by 44.59 $^{\circ}$ and 41.89 $^{\circ}$ for A and B, respectively.

In the absence of potential donor-acceptor groups in these heterocyclic compounds, the stability of supra-molecular structure is mainly due to relatively weak but significant C—H \cdots π , π — π interactions. Molecule A and its centro-symmetry related pair gets superimposed centering at 0,0,1. The molecular aggregate so formed are held together by two pairs of C—H \cdots π hydrogen bonds [Fig.2], one intra involving C25—H251 with Cg(3) (the centroid of the ring C17—C18—C19—C20—C21—C22) and the other intermolecular involving C18—H18 with Cg(1) (the centroid of the ring N6—C5—C4—C9—N8—C7) at 1- x , - y , 1- z . The C—H \cdots π interactions involving molecule B and its symmetry related partner is very similar to that of molecule A but this time centered at 0,1,0. The intramolecular hydrogen bond involves C53—H531 to Cg(4) (the centroid of the ring C45—C46—C47—C48—C49—C50) and the intermolecular hydrogen bond is between C46—H46 with Cg(2) (the centroid of the ring N34—C33—C32—C37—N36—C35) at - x , 1 - y , 2 - z . The details of the

geometry of these interaction is in Table 1. The striking feature of the C—H $\cdots\pi$ hydrogen bond is that these interactions do not interlink molecules A and B, but it involves only individual molecules. The interactions involve the same group of moieties of the two molecules and is of same length. All of the four C—H $\cdots\pi$ interactions are of type-III as described by Malone *et al.*, 1997, indicating an exact similarities in the C—H $\cdots\pi$ interactions. In addition, direction specific $\pi\cdots\pi$ interaction involving symmetry related pyrrole ring of molecule B at -1-x, 1-y, 2-z contribute further to the stability of molecular packing along the [100] direction; their centroids are separated by 4.390 Å [Fig.3]. However, this interaction is absent in molecule A. In the molecule, the closest approach distance between two symmetry ($x - 1, -y + 1, Z+1$) related chlorines is 3.883 (2) Å.

S2. Experimental

A uniform mixture of 4-chloro-5-(4-Chlorophenyl)-7-(4-methylphenyl)-7*H*-pyrrolo[2,3-*d*]pyrimidine and pyrrolodine was heated in an oil bath at 80–90° C with stirring. The heating was continued till the starting compound was consumed. The pH of reaction mixture was maintained and the final product was separated from a mixture of ethanol and *N,N*-dimethylformamide.

S3. Refinement

All the H atoms were placed in geometrically idealized positions with C—H distances of 0.96 Å (methyl) or 0.93 Å (aromatic) and constrained to ride on their parent atoms with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for the phenyl H atoms and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for the methyl H atoms.

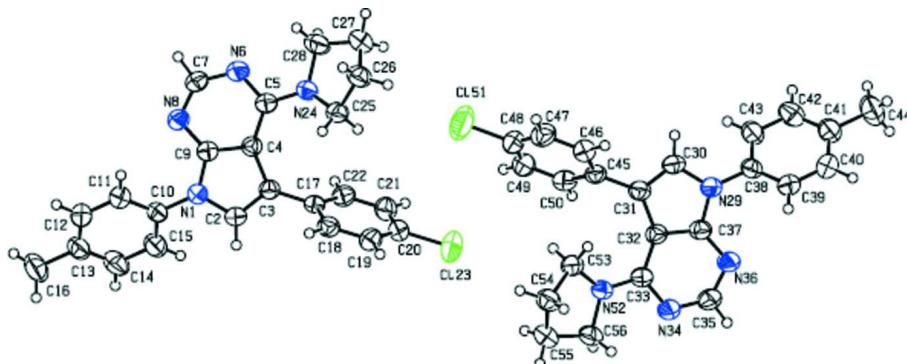

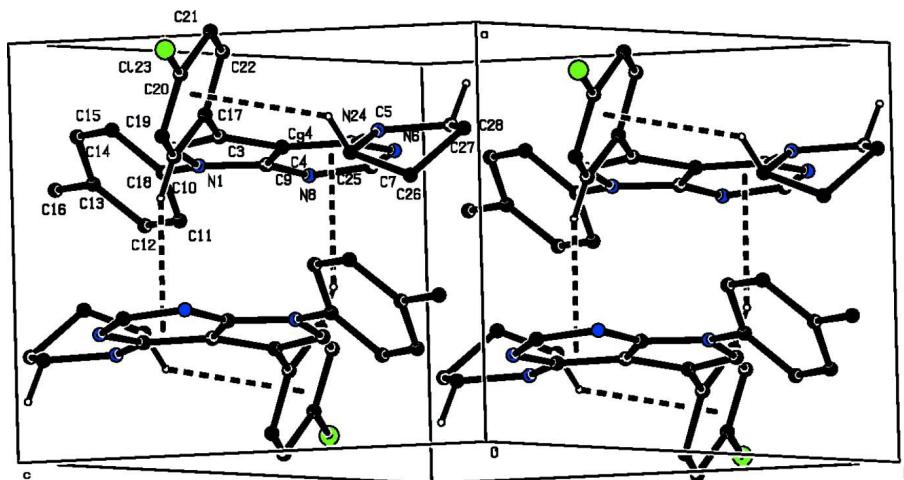

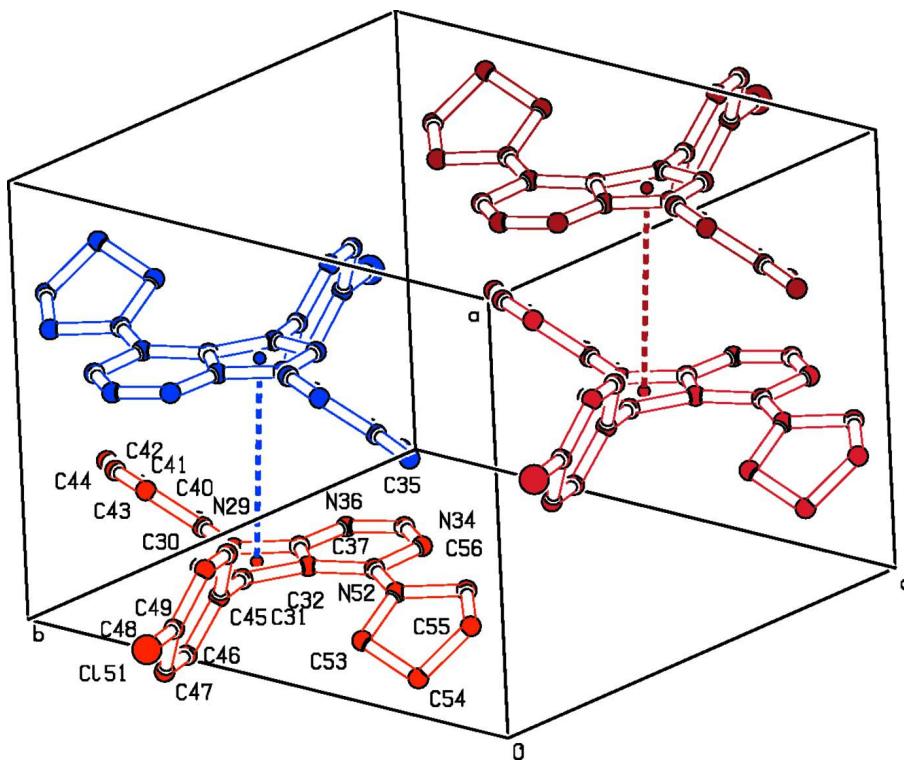

Figure 1

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg1, Cg2, Cg3 and Cg4 are the centroids of the N6/C5/C4/C9/N8/C7, N34/C33/C32/C37/N36/C35, C17—C22 and C45—C50 rings, respectively.

D—H···A	D—H	H···A	D···A	D—H···A
