

(2,2'-Bipyridine- $\kappa^2 N,N'$)tetrakis(dimethyl sulfoxide- κO)copper(II) bis(perchlorate)

Turganbay Iskenderov

Department of Chemistry, National Taras Shevchenko University, Volodymyrska, Str. 64, 01601 Kyiv, Ukraine
Correspondence e-mail: tiskenderov@ukr.net

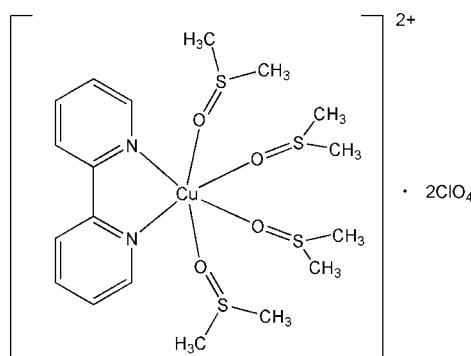

Received 8 June 2013; accepted 3 July 2013

Key indicators: single-crystal X-ray study; $T = 120\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; disorder in solvent or counterion; R factor = 0.075; wR factor = 0.160; data-to-parameter ratio = 36.3.

The title compound, $[\text{Cu}(\text{C}_2\text{H}_6\text{OS})_4(\text{C}_{10}\text{H}_8\text{N}_2)](\text{ClO}_4)_2$, contains a Cu^{II} ion with a distorted octahedral coordination environment, bonded by four O atoms of the monodentate dimethyl sulfoxide ligands and two N atoms of the bidentate chelating 2,2'-bipyridine ligand. The equatorial Cu–N and Cu–O bond lengths are in the range 1.979 (2)–1.998 (3) Å. The axial Cu–O bond distances are 2.365 (2) and 2.394 (2) Å. In the crystal, the complex cations and perchlorate anions are connected by numerous C–H···O hydrogen bonds, which leads to additional stabilization of the structure. The perchlorate anion is disordered over two sets of sites with a 0.716 (3):0.284 (3) occupancy ratio.

(2,2'-Bipyridine- κ^2N,N')tetrakis(dimethyl sulfoxide- κO)copper(II) bis-(perchlorate)

Turganbay Iskenderov

S1. Comment

2,2'-Bipyridyl (2,2'-bipy) is a well known neutral bidentate ligand which is widely used in coordination chemistry, in particular, for the preparation of mixed ligand complexes (Fritsky *et al.*, 2004; Kandleral *et al.*, 2005). It is also often used in the synthesis of discrete polynuclear complexes in order to prevent formation of coordination polymers by blocking a certain number of vacant sites in the coordination sphere of a metal ion (Fritsky *et al.*, 2006). The title compound was obtained unintentionally during an attempt to synthesize a mixed-ligand complex of Cu^{II} with pyridine-2-hydroxamic acid in the framework of our project on study of metal complexes of heterocyclic hydroxamic acids (Świątek-Kozłowska *et al.*, 2002; Golenya *et al.*, 2012a). The crystal structure of the title complex has not hitherto been reported.

The title compound, $[\text{Cu}(\text{C}_{10}\text{H}_8\text{N}_2)(\text{C}_2\text{H}_6\text{OS})_4](\text{ClO}_4)_2$, consists of a cationic Cu²⁺ complex and two perchlorate anions (Fig. 1). The central atom is in distorted octahedral environment formed by two nitrogen donor atoms of bidentately coordinated molecule of 2,2'-bipyridine and by four oxygen atoms of dimethyl sulfoxide molecules. The equatorial plane of the coordination polyhedron is consisting of two nitrogen atoms of 2,2'-bipyridyl and two oxygen atoms of two dimethyl sulfoxide ligands. The axial positions are occupied by oxygen atoms of other two dimethyl sulfoxide ligands. The equatorial Cu—N and Cu—O bond lengths are in the range 1.979 (2) – 1.998 (3) Å. The axial Cu—O bond distances are 2.365 (2) Å and 2.394 (2) Å. The coordination bond lengths Cu—N and Cu—O are typical for distorted octahedral Cu^{II} complexes with the nitrogen and oxygen donors (Fritsky *et al.*, 1998; Świątek-Kozłowska *et al.*, 2000; Sliva *et al.*, 1997). The N2—Cu1—N1 bite angle is decreased to 81.45 (11)°, which is a consequence of the formation of five-membered chelate ring. The C—N and C—C bond lengths in the pyridine rings are normal for 2-substituted pyridine derivatives (Fritsky *et al.*, 2000; Iskenderov *et al.*, 2009; Moroz *et al.*, 2010; Moroz *et al.*, 2012).

In the crystal structure, the complex cations and perchlorate anions are connected by numerous intermolecular C—H···O hydrogen bonds, in which the aromatic and methyl carbon atoms act as donors while the perchlorate oxygen atoms act as acceptors, which contribute to the stabilization of the structure (Fig. 2). There are also stacking interactions between the aromatic rings of the 2,2'-bipyridine molecules belonging to the neighboring complex molecules with shortest non-covalent contacts C(2)···C(6) (-*x*, 1 - *y*, -*z*) = 3.369 (5) and C(4)···C(10) (-*x*, 1 - *y*, -*z*) = 3.390 (5) Å (Fig. 2).

S2. Experimental

The title compound was obtained unexpectedly during an attempt to synthesize a mixed-ligand complex of Cu^{II} with pyridine-2-hydroxamic acid (Golenya *et al.*, 2012b) in aqueous methanol solution. Cu(ClO₄)₂·6H₂O in methanol (0.0370 g, 0.1 mmol) was added to solution of 2,2'-bipyridine (0.156 g, 1 mmol) and pyridine-2-hydroxamic acid (0.069 g, 0.5 mmol) in methanol (7 ml), afterwards the obtained transparent blue solution left for evaporation in the air at ambient temperature. The obtained dry solid residue was dissolved in 5 ml DMSO and set for crystallization by slow diffusion of 2-propanol vapors at room temperature. During 12 h the blue crystals suitable for X-ray analysis were obtained. They

were filtered off, washed with 2-propanol and dried in the air. Yield: 73%. Elemental analysis calc. (%) for $C_{18}H_{32}Cl_2CuN_2O_{12}S_4$: C 29.63; H 4.42; N 3.84; found: C 29.78; H 4.60; N 3.63.

S3. Refinement

The C—H atoms were positioned geometrically and refined as riding atoms, with C—H = 0.95(CH), 0.98(CH₃) and U_{iso} = 1.2 or 1.5 U_{eq} (parent atom) for CH and CH₃, respectively. One of the perchlorate anions were found to be disordered over two positions with occupancy factors 0.716/0.284. All atoms were refined with anisotropic displacement parameters except the oxygen atoms of the disordered perchlorate which were refined isotropically. Cl—O bond distances and O···O separations of both (minor and major) fractions of the disordered perchlorate anion as well as the ordered perchlorate (as a model) were restrained to have identical values. For each corresponding pair of the oxygen atoms of the disordered perchlorate anion, the isotropic displacement parameters were restrained to have identical values.

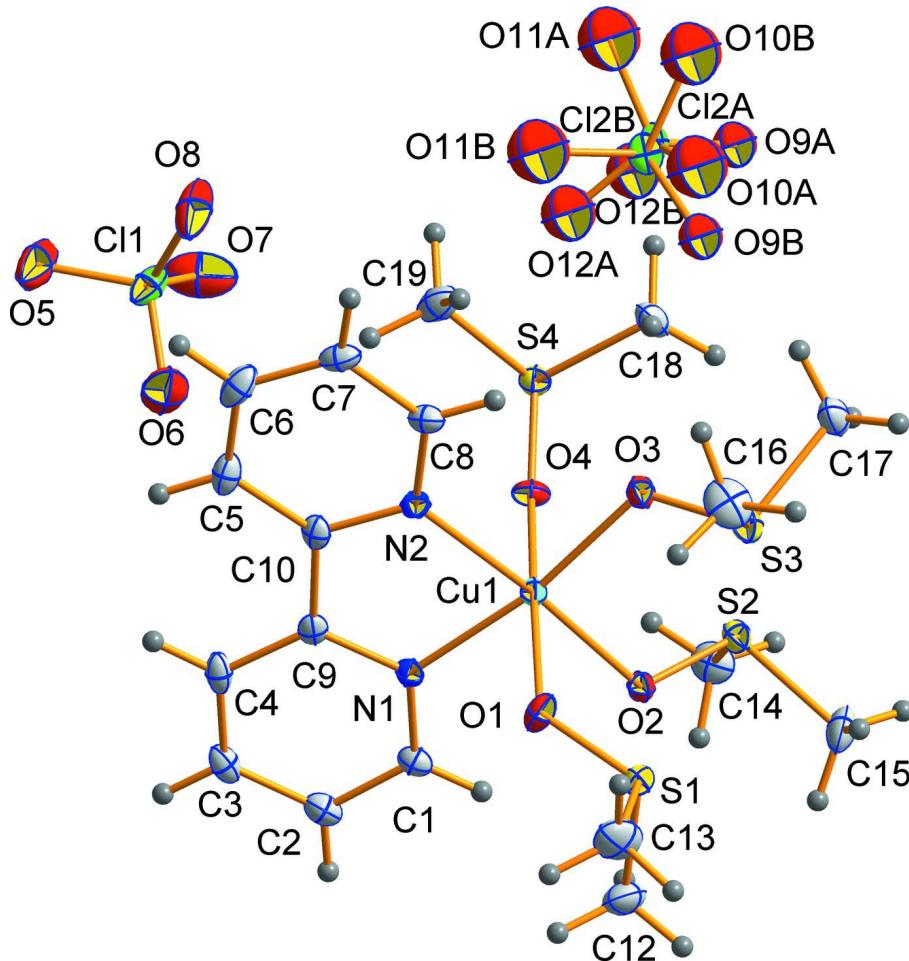

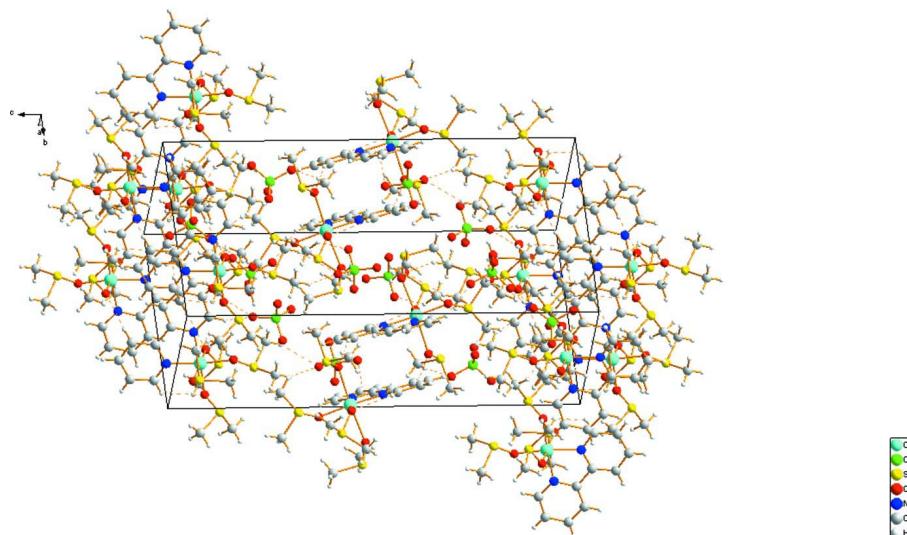

Figure 1

A view of the title compound, with displacement ellipsoids shown at the 40% probability level. Both orientations for the disordered perchlorate anion are shown. H atoms are drawn as spheres of arbitrary radii.

**Figure 2**

Crystal packing of the title compound. Hydrogen bonds are indicated by dashed lines. Only major orientation is shown for the disordered perchlorate anion.

Special details

Experimental. The C—H atoms were positioned geometrically and refined as riding atoms, with C—H = 0.95(CH), 0.98(CH₃) and U_{iso} = 1.2 or 1.5 U_{eq}(parent atom) for CH and CH₃, respectively. One of the perchlorate anions were found to be disordered over two positions with occupancy factors 0.716/0.284. All atoms were refined with anisotropic displacement parameters except the oxygen atoms of the disordered perchlorate which were refined isotropically. Cl—O bond distances and O···O separations of both (minor and major) fractions of the disordered perchlorate anion as well as the ordered perchlorate (as a model) were restrained to have identical values. For each corresponding pair of the oxygen atoms of the disordered perchlorate anion, the isotropic displacement parameters were restrained to have identical values.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F² against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F², conventional R-factors R are based on F, with F set to zero for negative F². The threshold expression of F² > 2sigma(F²) is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F² are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
