Received 2 August 2013; accepted 5 August 2013

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.060; wR factor = 0.159; data-to-parameter ratio = 17.9.

The title compound, $[\text{Fe}(\text{C}_6\text{HF}_4\text{O})(\text{C}_{48}\text{H}_{36}\text{N}_4\text{O}_4)] \cdot \text{C}_6\text{H}_{12}$, represents a five-coordinate iron(III) porphyrin complex in a square-pyramidal geometry with a tetrafluorophenolate anion as the axial ligand. The Fe^{III} atom is displaced by $0.364(2)\text{ \AA}$ from the 24-atom mean plane of the porphyrinate ring towards the tetrafluoro phenolate anion. The average $\text{Fe}-\text{N}$ distance is $2.053(2)\text{ \AA}$ and the $\text{Fe}-\text{O}$ distance is $1.883(2)\text{ \AA}$. A porphyrin aryl H atom points in the general direction of the phenoxide ring. The mean plane separation between the 24-atom porphyrin planes of two adjacent porphyrin rings is $\sim 3.7\text{ \AA}$, and the lateral shift is $\sim 3.5\text{ \AA}$ resulting in an $\text{Fe}\cdots\text{Fe}$ separation of $5.6167(14)\text{ \AA}$.

(2,3,5,6-Tetrafluorophenolato)[5,10,15,20-tetrakis(4-methoxyphenyl)-porphyrinato]iron(III) cyclohexane monosolvate

Nan Xu, Douglas R. Powell and George B. Richter-Addo

S1. Comment

Synthetic metalloporphyrins have been studied intensively due to their potential to act as models for heme enzymes in biological systems. Catalase is a heme enzyme that catalyzes the decomposition of hydrogen peroxide to water and oxygen (Nicholls *et al.*, 2001). Heme catalase contains an active-site tyrosine, a phenolato type ligand, that binds to the heme iron center (Nicholls *et al.*, 2001). A number of iron phenolate porphyrin complexes has been prepared and structurally characterized (Chaudhary *et al.*, 2010, Ueyama *et al.*, 1998, Kanamori *et al.*, 2005). In this paper, we report the structure of (5,10,15,20-tetrakis(4-methoxyphenyl)porphyrinato)(tetrafluorophenolato)iron(III) with a cyclohexane monosolvate.

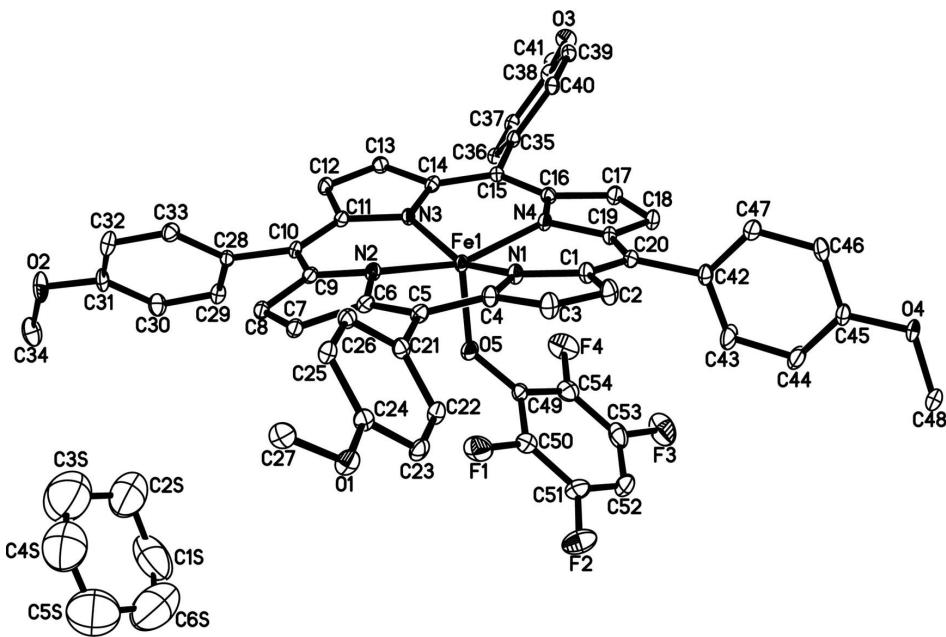

The molecular structure of (5,10,15,20-tetrakis(4-methoxyphenyl)porphyrinato)(2,3,5,6-tetrafluorophenolato)iron(III) is shown in Fig. 1. The porphyrin core of is saddle shaped. The iron atom is displaced by 0.364 (2) Å from the 24-atom mean porphyrin plane toward the tetrafluorophenolate anion. In addition, the Fe—N_p distances range from 2.048 (2) Å to 2.056 (2) Å, suggesting a high-spin ferric center (Scheidt & Reid, 1981). The Fe—O distance is 1.883 (2) Å which is typical of Fe—O bond distances in the iron phenolate porphyrin complexes reported previously. The Fe—O—C linkage shows a bent geometry with a bond angle of 130.46 (17)°.

S2. Experimental

To a CH₂Cl₂ solution (20 ml) of [(T(p-OMe)PP)Fe]₂O (Helms *et al.*, 1986) (0.030 g, 0.019 mmol) was added 2,3,5,6-tetrafluorophenol (0.051 g, 0.307 mmol) (purchased from Aldrich Chemical Company and used as received) under N₂. After stirring for 1 h, the color of the solution changed from green to red. The solution was reduced to 2 ml under reduced pressure, and 10 ml hexane was added. The resulting black precipitation was collected by filtration and dried under vacuum. A suitable prism-shaped crystal was grown by slow evaporation of a CH₂Cl₂-cyclohexane (1:1) solution of the complex at room temperature under N₂.

S3. Refinement

The positions of H atoms bonded to carbons were initially determined by geometry and were refined using a riding model. H atoms bonded to N atoms and O atoms were located on a difference map, and their positions were refined independently. Non-hydrogen atoms were refined with anisotropic displacement parameters. Hydrogen atom displacement parameters were set to 1.2 (1.5 for methyl) times the isotropic equivalent displacement parameters of the bonded atoms. Carbon-bound H atoms were placed in calculated positions (aromatic 0.95, ethyl 0.99, and methyl 0.95 Angstroms) and were refined using a riding model. The C—C bond distances in the cyclohexane were restrained to 1.52 Angstroms and the 1–3 C···C distances were restrained to be equal. Rigid-bond restraints were also applied to the anisotropic displacement parameters of the solvent carbons.
