

2,3-Diphenyl-2,3,5,6-tetrahydro-4*H*-1,3-thiazin-4-one. Corrigendum

Hemant P. Yennawar^a and Lee J. Silverberg^{b*}

^aDepartment of Chemistry, Pennsylvania State University, University Park, PA 16802, USA, and ^bPennsylvania State University, Schuylkill Campus, 200 University Drive, Schuylkill Haven, PA 17972, USA. *Correspondence e-mail: ljs43@psu.edu

Received 29 November 2015; accepted 30 November 2015

In the paper by Yennawar & Silverberg [*Acta Cryst.* (2014), E70, o133], the conformation of the thiazine ring was reported incorrectly.

The authors of Yennawar & Silverberg (2014) have indicated that the conformation of the thiazine ring in the title compound should be an envelope, with the S atom forming the flap, and not half-chair as originally given.

Received 7 November 2013; accepted 6 January 2014

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.061; wR factor = 0.140; data-to-parameter ratio = 19.4.

The six-membered thiazine ring in the title compound, $\text{C}_{16}\text{H}_{15}\text{NOS}$, adopts a half-chair conformation, with the S atom forming the back of the chair. The base of the chair has a slight twist reflected in the r.m.s. deviation (0.0756 \AA) of those five atoms from the plane defined by them. The phenyl substituents are almost perpendicular to each other [dihedral angle $87.06(9)^\circ$]. In the crystal, molecules are linked into chains parallel to the c axis through $\text{C}-\text{H}\cdots\text{O}$ interactions.

2,3-Diphenyl-2,3,5,6-tetrahydro-4*H*-1,3-thiazin-4-one

Hemant P. Yennawar and Lee J. Silverberg

S1. Comment

The 2,3,5,6-tetrahydro-1,3-thiazin-4-ones are an important class of heterocycle with substantial biological activity (Ryabukhin *et al.*, 1996). Surrey has reported that the title compound could not be prepared by condensation of *N*-benzylideneaniline with 3-mercaptopropionic acid in refluxing benzene, unlike when the imine was *N*-alkyl (Surrey *et al.*, 1958). Here we report the synthesis of the novel title molecule by condensation of *N*-benzylideneaniline with 3-mercaptopropionic acid in the presence of 2,4,6-tripropyl-1,3,5,2,4,6-trioxatriphosphorinane-2,4,6-trioxide (T3P) and pyridine (Dunetz *et al.*, 2011). We have recently reported the syntheses of 2-(3-nitrophenyl)-3-phenyl-2,3-dihydro-4*H*-1,3-benzothiazin-4-one (Yennawar *et al.*, 2013) and 6,7-diphenyl-5-thia-7-azaspiro[2.6]nonan-8-one (Yennawar & Silverberg, 2013) by this method. A similar preparation of a 2,3-dialkyl-2,3-dihydro-1,3-benzothiazin-4-one was also recently reported (Unsworth *et al.*, 2013).

S2. Experimental

A two-necked 25 ml roundbottom flask was oven-dried, cooled under N₂, and charged with a stir bar and *N*-benzylideneaniline (1.087 g, 6 mmol). Tetrahydrofuran (2.3 ml) was added, the solid dissolved, and the solution was stirred. Pyridine (1.95 ml, 24 mmol) was added and then 3-mercaptopropionic acid (0.523 ml, 6 mmol) was added. Finally, 2,4,6-tripropyl-1,3,5,2,4,6-trioxatriphosphorinane-2,4,6-trioxide in 2-methyltetrahydrofuran (50 weight percent; 7.1 ml, 12 mmol) was added. The reaction was stirred at room temperature for 23 h, then poured into a separatory funnel with dichloromethane (20 ml). The mixture was washed with water (10 ml). The aqueous was then extracted twice with dichloromethane (10 ml each). The organics were combined and washed with saturated sodium bicarbonate (10 ml) and saturated sodium chloride (10 ml). The organic was dried over sodium sulfate, concentrated *in vacuo* and chromatographed on 30 g flash silica gel, eluting with mixtures of ethyl acetate and hexanes (20% to 100% ethyl acetate). The product eluted with 60–100% EtOAc/hexanes and was concentrated *in vacuo* to pale yellow viscous oil (1.3720 g). Recrystallization from ethanol gave white solid (0.7669 g, 47.5%). m.p.: 95–96.5°C. R_f = 0.32 (50% EtOAc/hexanes). Crystals for X-ray crystallography were grown by dissolving the solid in ethanol, adding some water, and then allowing slow evaporation to occur. After crystals grew, the supernatant was decanted off, and the crystals were rinsed twice with 95% ethanol.

S3. Refinement

The C-bound H atoms were geometrically placed with C—H = 0.93–0.97 Å, and refined as riding with U_{iso}(H) = 1.2U_{eq}(C).

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
