Received 20 January 2014; accepted 11 February 2014

Key indicators: single-crystal X-ray study; $T = 173\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.042; wR factor = 0.122; data-to-parameter ratio = 12.9.

In the title salt, $\text{C}_6\text{H}_{12}\text{N}_3^+\cdot\text{C}_7\text{H}_3\text{N}_2\text{O}_7^-$, the imidazole ring is planar, with a maximum deviation of 0.0013 (14) Å for the N attached to the propanaminium group. In the anion, a single intramolecular O—H···O hydrogen bond is observed. The mean planes of the nitro groups in the anion are twisted from the benzene ring mean plane making dihedral angles of 24.7 (9) and 3.9 (6)°. In the crystal, the ammonium H atoms form N—H···N and N—H···O hydrogen bonds, resulting in an infinite chain along [111]. In addition to the classical hydrogen bonds, weak C—H···O and π — π [centroid–centroid distance = 3.7124 (9) Å] interactions are also observed, which lead to the formation a three-dimensional supramolecular structure that links the chains into layers along the *bc* plane.

3-(1H-Imidazol-1-yl)propanaminium 2-carboxy-4,6-dinitrophenolate

Thammarse S. Yamuna, Manpreet Kaur, Brian J. Anderson, Jerry P. Jasinski and H.S. Yathirajan

S1. Comment

Imidazole rings appear frequently in biologically active compounds, both natural and man-made (ten Have *et al.*, 1997). Compounds with an imidazole ring system have many pharmacological properties and play important roles in biochemical processes (Lombardino & Wiseman, 1974). Most of the imidazole compounds are known as inhibitors of fungicides and herbicides, plant growth regulators and therapeutic agents (Maier *et al.*, 1989), anticancer agents (Krezel, 1998) and bactericidal effects (Jackson *et al.*, 2000). The crystal structures of some related compounds, viz ; 2-amino-5-methylpyridinium 2-hydroxy-3,5-dinitrobenzoate (Hemamalini *et al.*, 2010); Cinnarizinium 3,5-dinitrosalicylate (Dayananda *et al.*, 2012); Enrofloxacinium picrate (Jasinski *et al.*, 2011); 3-(1H-imidazol-1-yl)propanaminium picrate (Yamuna *et al.*, 2013); 3,5-dimethylpyrazolium 3,5-dinitrosalicylate (Wei *et al.*, 2012), have been reported. In view of the importance of substituted imidazoles and organic acid–base adducts based on hydrogen bonding and receiving great attention in recent years, this paper reports the crystal structure of the title salt, (I), $C_6H_{12}N_3^+ \cdot C_7H_3N_2O_7^-$.

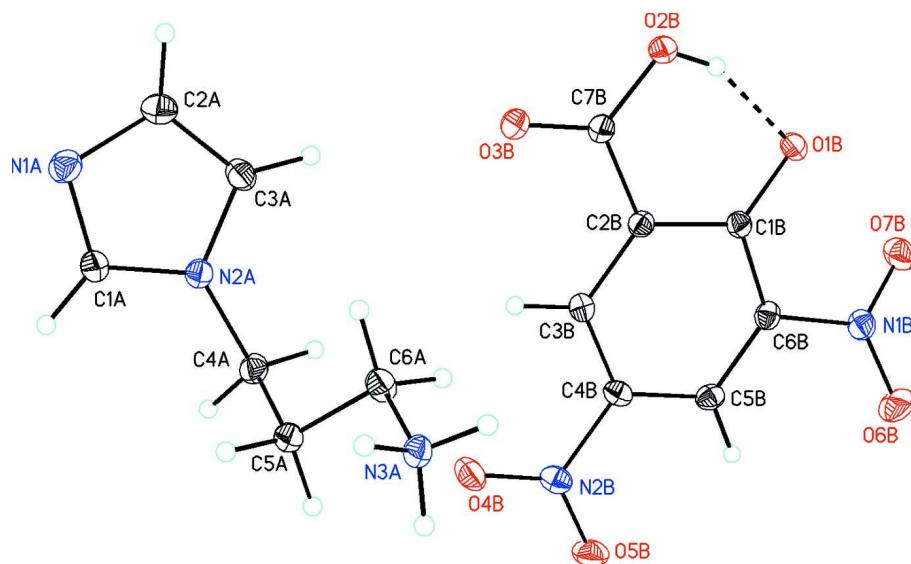

The title salt, (I), $C_6H_{12}N_3^+ \cdot C_7H_3N_2O_7^-$, crystallizes with one independent monocation (A) and monoanion (B) in the asymmetric unit (Fig. 1). In the cation the protonated imidazol-1-ium ring is planar (maximum deviation = 0.0013 (14) Å for N2A). In the anion, a single O—H···O intramolecular hydrogen bond is observed. Bond lengths are in normal ranges. The mean planes of the nitro groups in the anion are twisted from the phenyl ring mean plane with maximum angles of 24.7 (9)° and 3.9 (6)°, respectively. The hydrogen atoms on the terminal N atom of the cation form N—H···N and N—H···O intermolecular hydrogen bonds resulting in an infinite 1D chain along [1 1 1]. In the crystal, in addition to the classical hydrogen bonds, weak C—H···O (Table 1) and Cg1—Cg2 π—π intermolecular interactions are observed with an intercentroid distance of 3.7125 (9) Å (symmetry operation -x,1-y,-z; Cg1 and Cg2 are the centroids of the C1B–C6B and N1A/C1A/N2A/C3A/C2A rings) which contribute to crystal packing stability (Fig. 2).

S2. Experimental

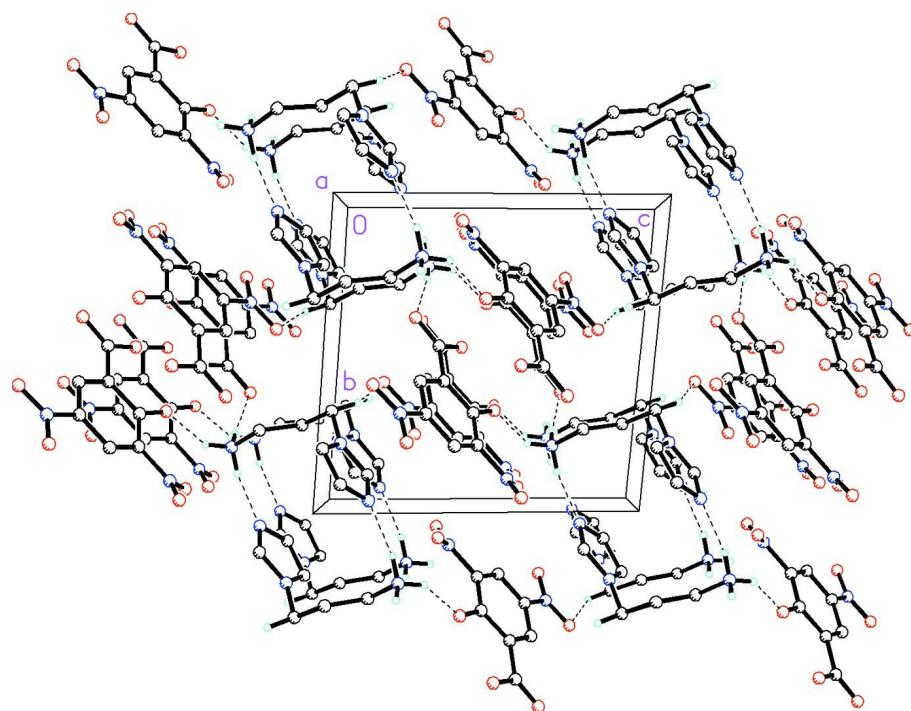

Commercially available 1-(3-aminopropyl)imidazole (0.5 g, 3.99 mmol) and 3,5 dinitrosalicylic acid (0.909 g, 3.99 mmol) were dissolved in 10 ml of methanol and stirred for 15 minutes at 308 K. X-ray quality crystals were formed on slow evaporation of methanol. (m.p.: 468–475 K).

S3. Refinement

All of the H atoms were placed in their calculated positions and then refined using the riding model with Atom—H lengths of 0.95 Å (CH); 0.99 Å (CH₂); 0.84 Å (OH) or 0.91 Å (NH₃). Isotropic displacement parameters for these atoms were set to 1.2 (CH, CH₂, NH₃) or 1.5 (OH) times U_{eq} of the parent atom. Idealised ammonium and tetrahedral OH were refined as rotating groups.

**Figure 1**

ORTEP drawing of (I) ($C_6H_{12}N_3^+ \cdot C_7H_3N_2O_7^-$) showing the labeling scheme with 30% probability displacement ellipsoids. Dashed lines indicate a $O2B-H2B\cdots O1B$ intramolecular hydrogen bond in the anion within the asymmetric unit.

**Figure 2**

Molecular packing for (I) viewed along the a axis. Dashed lines indicate $N-H\cdots O$, $N-H\cdots N$ intermolecular hydrogen bonds and weak $C-H\cdots O$ intermolecular interactions. H atoms not involved in hydrogen bonding have been removed for clarity.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
