Received 7 February 2014; accepted 18 February 2014

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; R factor = 0.036; wR factor = 0.072; data-to-parameter ratio = 17.0.

The title compound, $C_{22}H_{20}Br_2N_2S$, was synthesized under solvent-free conditions. The molecule shows crystallographic C_2 symmetry, with the S atom of the central thiophene ring lying on a twofold rotation axis. Furthermore, as a consequence of the (*S,S*) stereochemistry, the molecule has a twisted conformation. The dihedral angle between the thiophene and benzene rings is $72.7(2)^\circ$ and that between the two benzene rings is $55.9(2)^\circ$. In the crystal, molecules are arranged in a chevron-like pattern, without any significant intermolecular interactions.

2,5-Bis{[(-)-(S)-1-(4-bromophenyl)ethyl]iminomethyl}thiophene

Angel Mendoza, Sylvain Bernès, Guadalupe Hernández-Téllez, Oscar Portillo-Moreno and René Gutiérrez

S1. Comment

In continuation of our work focused on chiral bisimines (Espinosa Leija *et al.*, 2009; Bernès *et al.*, 2013), we have now synthesized the title compound under the solvent-free approach because of the cleaner, safer, and easier aspects to perform in the synthetic work. So, solvent-free conditions are becoming more popular and it is often claimed that the best solvent is no solvent. (Tanaka & Toda, 2000).

The bis-aldimine compound shows an *E* configuration over every imine bond (Fig. 1). The molecule is an (*S,S*) diastereoisomer as expected by synthetic procedure. The asymmetric unit contains a half-molecule. The S atom of the molecule is located on a twofold rotation axis of the space group *C*2. and as a consequence the Br-aldimines groups are placed opposite to the central thiophene ring. Only some previous reports of 2,5-thiophene compounds with achiral or chiral substituents have showed *C*2 crystallographic symmetry like title compound (Kudyakova *et al.*, 2012, space group *C*2/c; Bernès *et al.*, 2013, space group *P*2₁2₁). The crystal packing does not feature any particular interactions (intra or intermolecular) and the supramolecular arrangement in the solid state shows a chevron-like pattern viewed along the *b* axis (Fig. 2).

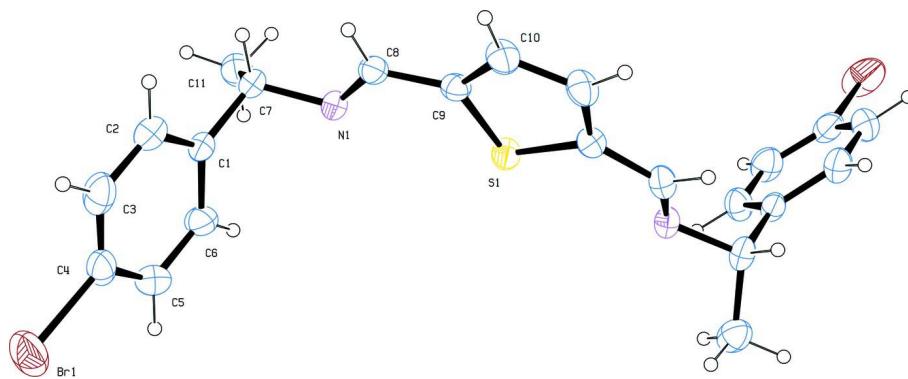

S2. Experimental

Under solvent-free conditions, a mixture of 2,5-thiophenedicarboxaldehyde (100 mg, 0.71 mmol) and (*S*)-(-)-1-(4-bromophenyl)ethylamine (285 mg, 1.42 mmol) in a 1:2 molar ratio were mixed at room temperature, giving a white solid. The crude was recrystallized from CH₂Cl₂, affording colorless crystals of the title compound.

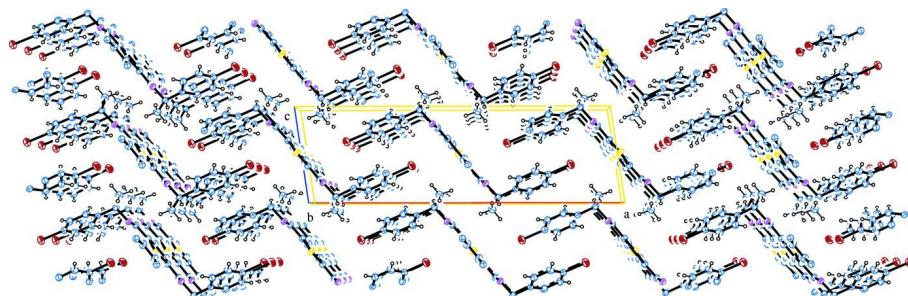

Yield 96%; m.p. 147–149 °C. Spectroscopic data: $[a]_D^{25} = +59.6$ (c 1, CHCl₃). IR (KBr): 1623 cm⁻¹ (C=N). ¹H NMR (400 MHz, CDCl₃/TMS): δ = 1.51, 1.53 (d, 6H, CHCH₃), 4.44, 4.45, 4.47, 4.49 (q, 2H, CH), 7.29–7.45 (m, 10 H, Ar), 8.36 (s, 2 H, HC=N). ¹³C NMR (100 MHz, CDCl₃/TMS) δ = 25.1 (CCH₃), 68.7 (CHCH₃), 120.6 (Ar), 128.3 (Ar), 130.1 (Ar), 131.4 (Ar), 144.0 (Ar), 145.1 (Ar), 152.7 (HC=N). MS—EI: *m/z* = 504 (*M*⁺).

S3. Refinement

The absolute configuration was determined using the anomalous dispersion of the Br atom, and was that expected from the synthesis, carried-out with an enantiomerically pure amine. All H atoms were placed in calculated positions, with C—H bond lengths fixed to 0.96 Å for the methyl group and 0.93 Å for aromatic CH groups. Isotropic displacement parameters were calculated as $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{carrier atom})$ for the methyl group and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{carrier atom})$ otherwise.

**Figure 1**

The molecular structure of title compound, with atom labels and 30% probability displacement ellipsoids for non-H atoms.

**Figure 2**

A packing diagram of the title compound, viewed along the *b* axis.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
