Received 7 March 2014; accepted 18 March 2014

Key indicators: single-crystal X-ray study; $T = 130\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.058; wR factor = 0.132; data-to-parameter ratio = 16.6.

The asymmetric unit of the title compound, $\text{C}_{19}\text{H}_{22}\text{FN}_3\text{O}_3^+ \cdot \text{Cl}^- \cdot 2\text{H}_2\text{O}$ [systematic name: 4-(3-carboxy-1-cyclopropyl-6-fluoro-4-oxo-1,4-dihydroquinolin-7-yl)-1-ethylpiperazin-1-ium chloride dihydrate], consists of two independent monocations of the protonated enrofloxacin, two chloride anions and four water molecules. In the cations, the piperazinium rings adopt chair conformations and the dihedral angles between the cyclopropyl ring and the 10-membered quinoline ring system are $56.55(2)$ and $51.11(2)^\circ$. An intramolecular $\text{O}-\text{H} \cdots \text{O}$ hydrogen bond is observed in each cation. In the crystal, the components are connected via $\text{O}-\text{H} \cdots \text{Cl}$, $\text{N}-\text{H} \cdots \text{Cl}$ and $\text{O}-\text{H} \cdots \text{O}$ hydrogen bonds, and a $\pi-\pi$ interaction between the benzene rings [centroid–centroid distance = $3.6726(13)\text{ \AA}$], resulting in a three-dimensional array.

Enrofloxacin hydrochloride dihydrate

Jorge E. Miranda-Calderón, Lilia Gutiérrez, Marcos Flores-Alamo, Ponciano García-Gutiérrez and Héctor Sumano

S1. Comment

Enrofloxacin is a synthetic antimicrobial agent that belongs to the group of synthetic 6-fluoroquinolones (Sárközy, 2001). Essential for the broad spectrum and the excellent antimicrobial efficacy is the fluorine substituent at position C6 and the piperazine ring at C7. The development of pharmaceutical derivatives of active principles such as salts, represent extensions of chemical space wherein enhanced or new chemical and physical properties may lead to extended use of a given drug as a therapeutic agent. Hence, the aim of this trial was produce enrofloxacin hydrochloride salt in order to improve its pharmacokinetic behavior (Sumano & Gutierrez, 2013).

The title compound crystallizes with two independent monocations (**A** and **B**) of the enrofloxacin protonated (EnrH^+), two chloride anions and four water molecules solvent (Fig. 1). The piperazinium rings in both the cations adopt chair conformations. For **A** molecule, puckering parameters (Cremer & Pople, 1975) are $Q = 0.588$ (3) Å, $\theta = 178.42$ (19), $\varphi = 346$ (12)° (if the calculation starts from N2A to C17A and proceeds in a counterclockwise direction) with asymmetry parameters (Duax *et al.*, 1976): $\Delta C_2(\text{N2A—C14A}) = 0.8$ (3), $\Delta C_2(\text{C14A—C15A}) = 0.6$ (3), $\Delta C_2(\text{C15A—N3A}) = 0.4$ (3), $\Delta C_s(\text{N2A}) = 0.6$ (2), $\Delta C_s(\text{C14A}) = 0.2$ (2), $\Delta C_s(\text{C15A}) = 0.7$ (2) and $\Delta C_s(\text{C17A}) = 0.7$ (2)° with a weighted average absolute torsion angle of 58.20 (12)° and weighted average ring bond distance of 1.4931 (13) Å. For **B** molecule, puckering parameters are $Q = 0.586$ (3) Å, $\theta = 3.8$ (2), $\varphi = 200$ (4)° (if the calculation starts from N2B to C17B and proceeds in a counterclockwise direction) with asymmetry parameters: $\Delta C_2(\text{N2B—C14B}) = 0.4$ (3), $\Delta C_2(\text{C14B—C15B}) = 3.3$ (3), $\Delta C_2(\text{C15B—N3B}) = 3.5$ (3), $\Delta C_s(\text{N2B}) = 1.9$ (2), $\Delta C_s(\text{C14B}) = 1.4$ (2), $\Delta C_s(\text{C15B}) = 3.2$ (2) and $\Delta C_s(\text{C17B}) = 3.2$ (2)° with a weighted average absolute torsion angle of 57.93 (12)° and weighted average ring bond distance of 1.4930 (13) Å. Bond lengths are in normal ranges (Allen *et al.*, 1987) and to previously reported (Yamuna *et al.*, 2014). The dihedral angles between the mean planes of the cyclopropyl ring and the 10-membered quinoline ring are 56.55 (2) and 51.11 (2)° for **A** and **B** molecules, respectively.

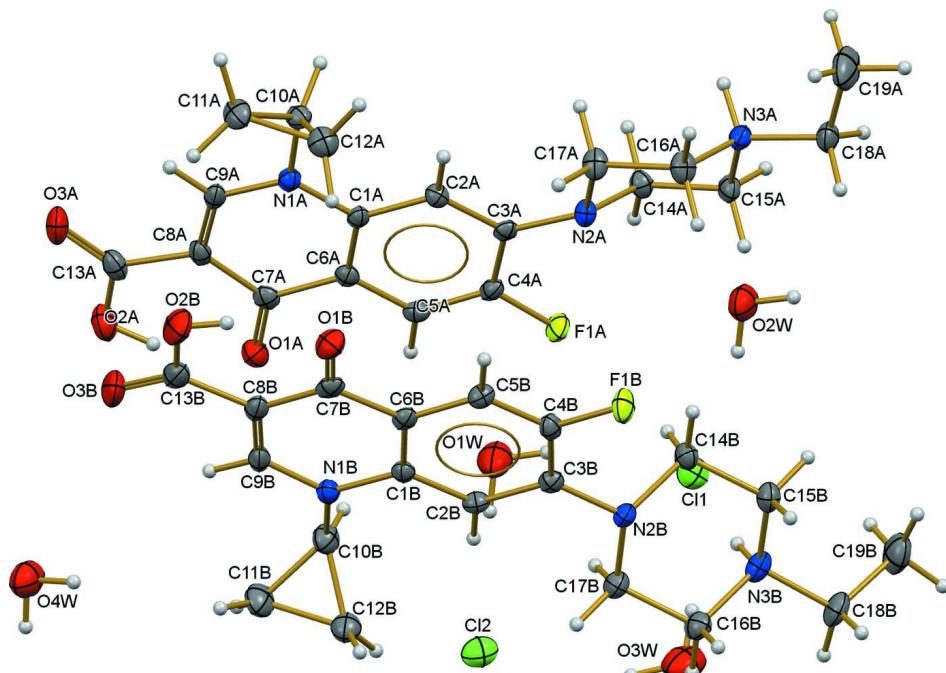

In each cation, an intramolecular O—H···O hydrogen bond is observed [O2A—H2F···O1A and O2B—H2G···O1B (Table 1 & Fig. 2)]. In the crystal, there are classic hydrogen bonds (Table 1) mainly between the N atoms of the EnrH^+ and the O atoms of the water molecules as donor atoms, and the Cl⁻ anions and the O atoms of the carboxyl groups as acceptors. The O1W—H1D···Cl1, O1W—H1E···Cl2, O3W—H3D···Cl1 and O3A—H3E···Cl2 hydrogen bonds form an $R_{4}^{2}(8)$ motif (Etter *et al.*, 1990), while the N3A—H3F···Cl2, O4W—H4D···Cl2 and O4W—O4E···O3A hydrogen bonds form a $C_{3}^{2}(17)$ motif running along the crystallographic *c* axis. Finally, **A** and **B** molecules form a π — π interaction between $Cg4$ ··· $Cg9$ [3.6726 (13) Å], where $Cg4$ and $Cg9$ are the centroids of the C1A—C6A, C1B—C6B benzene rings, respectively.

S2. Experimental

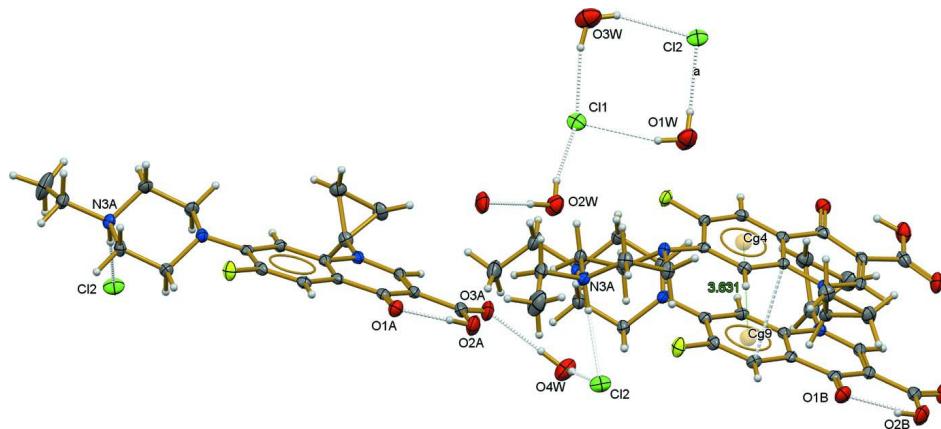

The enrofloxacin hydrochloride crystals (Sumano & Gutierrez, 2013) were formed after one month by slow evaporation at room temperature from saturated solution in a mixture of water-ethanol-acetone (3:2:1). Single crystals for X-ray determination were separated by filtration with $0.45\text{ }\mu\text{m}$ -pore membrane and vacuum. Mass spectrum of enrofloxacin hydrochloride presents two principal signals around to m/z 394 and 753 (M^-), four peaks at m/z 394.1313, 395.1336, 396.1285 and 397.1305 (M^+) corresponding to the deprotonated molecular ion $[M - \text{H}]^-$ with the characteristic isotopic pattern (3:1) that confirms the presence of one chlorine atom.

S3. Refinement

H atoms of the hydroxy groups and the amine groups were located in a difference map and their positions were refined with bond-length restraints of $\text{O}-\text{H} = 0.86$ (2) Å and $\text{N}-\text{H} = 0.92$ (2) Å, and with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ and $1.2U_{\text{eq}}(\text{N})$. H atoms attached to C atoms were placed in geometrically idealized positions, and refined as riding on their parent atoms, with $\text{C}-\text{H}$ distances of 0.95–1.00 Å, and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ or $1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$.

**Figure 1**

The molecular structure of the title compound. Displacement ellipsoids are drawn at the 50% probability level and H atoms are shown as circles of arbitrary size.

**Figure 2**

Intramolecular O—H···O hydrogen bonds, intermolecular hydrogen bonds forming the $R_4^2(8)$ and $C_3^2(17)$ motifs and a π — π interaction between **A** and **B** molecules.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
