Received 9 March 2014; accepted 24 March 2014

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.040; wR factor = 0.115; data-to-parameter ratio = 16.6.

The asymmetric unit of the title salt, $\text{C}_{36}\text{H}_{32}\text{N}_2^{2+} \cdot 2\text{C}_6\text{H}_4\text{ClO}_3\text{S}^-$, consists of one anion and one half-cation, the other half being generated by inversion symmetry. The dihedral angle between the pyridinium ring and the naphthalene ring system in the asymmetric unit is 42.86 (6)°. In the crystal, cations and anions are linked by weak $\text{C}-\text{H} \cdots \text{O}$ interactions into chains along [010]. Adjacent chains are further arranged in an antiparallel manner into sheets parallel to the bc plane. $\pi-\pi$ interactions are observed involving the cations, with centroid-centroid distances of 3.7664 (8) and 3.8553 (8) Å.

2,2'-[2,4-Bis(naphthalen-1-yl)cyclobutane-1,3-diyl]bis(1-methylpyridinium) bis-(4-chlorobenzenesulfonate): thermal-induced [2 + 2] cycloaddition reaction of a heterostilbene

Suchada Chantrapomma, Kullapa Chanawanno, Nawong Boonnak and Hoong-Kun Fun

S1. Comment

Stilbene derivatives have been reported to exhibit non-linear optical (NLO) property (Ruanwas *et al.*, 2010) and antibacterial activity (Chanawanno *et al.*, 2010). It has been known that [2 + 2] photodimerization of stilbenes to yield cyclobutane can occur (Papaefstathiou *et al.*, 2002). In our cases, the [2 + 2] cycloaddition of heterostilbene derivatives was carried out in solution by thermal-induced cycloaddition reaction, and we have previously reported the crystal structures of some of these derivatives (Chantrapomma *et al.*, 2012; Fun, Chanawanno & Chantrapomma, 2009; Fun, Surasit *et al.*, 2009). The title compound (I) was obtained by the cycloaddition of *trans*-heterostilbene to give a *syn* head-to-tail product (Yayli *et al.*, 2004; Zhang *et al.*, 2013). We report herein the synthesis and crystal structure of (I).

The asymmetric unit of (I), $C_{36}H_{32}N_2^{2+} \cdot 2(C_6H_4ClO_3S^-)$, consists of one half of a cation and one anion. The cation lies on an inversion center and the other half is generated by the symmetry operator $2-x, 1-y, 2-z$ (Fig. 1). The naphthalene (C7–C16) moiety is planar with a *r.m.s.* of 0.0183 (2) Å. The dihedral angle between the pyridinium ring (N1/C19–C23) and the naphthalene ring system is 42.86 (6)°. The stereoisomer of (I) is *syn* head-to-tail (Yayli *et al.*, 2004). The cyclobutane ring makes dihedral angles of 85.61 (8) and 52.8 (6)° with the pyridinium and naphthalene rings, respectively. The bond lengths are in normal ranges (Allen *et al.*, 1987) and comparable with those found in closely related structures (Chantrapomma *et al.*, 2012; Fun, Surasit *et al.*, 2009; Fun, Chanawanno & Chantrapomma (2009).

The crystal packing of (I) is shown in Fig. 2. The cations and anions are alternatively arranged and linked into chains along the [0 1 0] direction through C—H \cdots O weak interactions (Table 1). Adjacent chains are arranged in a anti-parallel manner into sheets parallel to the (1 0 0) plane. $\pi \cdots \pi$ interactions are present with distances of $Cg_1 \cdots Cg_2 = 3.8553$ (8) Å and $Cg_1 \cdots Cg_3 = 3.7664$ (8) Å; Cg_1 , Cg_2 and Cg_3 are the centroids of the N1/C19–C23, C7–C10/C15/C16 and C10–C15 rings, respectively (Fig. 3). C—H \cdots π weak interactions are also observed (Table 1).

S2. Experimental

A solution of (*E*)-1-methyl-2-[2-(1-naphthyl)vinyl]pyridinium iodide (0.25 g, 0.67 mmol) in CH₃OH (20 ml) was mixed (1:1 molar ratio) with a solution of silver(I) 4-chlorobenzenesulfonate (0.20 g, 0.67 mmol) (Chantrapomma *et al.*, 2007) in CH₃OH (80 ml) and stirred for 30 min. The precipitate of silver iodide which formed was filtered and the filtrate was evaporated to give a yellow solid product. The yellow solid was repeatedly recrystallized for three times by dissolving the yellow solid in CH₃OH and the solution was heated at 323 K to get a clear solution. The [2 + 2] cycloaddition of (*E*)-1-methyl-2-[2-(1-naphthyl)vinyl]pyridinium occurred upon heating. Yellow plate-shaped single crystals of the title compound suitable for *X*-ray structure determination were obtained after recrystallization in CH₃OH by slow evaporation of the solvent at room temperature after a few weeks.

S3. Refinement

All H atoms were located in difference Fourier map and refined isotropically.

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
