Edited by D.-J. Xu, Zhejiang University (Yuquan Campus), China

In the centrosymmetric title compound, $C_{26}H_{16}N_4O_4$ [systematic name: 6,13-bis[(pyridin-4-yl)methyl]-6,13-diaza-tetracyclo[6.6.2.0^{4,10}]hexadeca-1,3,8,10,15-pantaene-5,7,-12,14-tetron], the central ring system is essentially planar [maximum deviation = 0.0234 (8) Å] and approximately perpendicular to the terminal pyridine ring [dihedral angle = 84.38 (3)°]. The molecules displays a *trans* conformation with the (pyridin-4-yl)methyl groups on both sides of the central naphthalene diimide plane. In the crystal, molecules are linked by π – π stacking between parallel pyridine rings [centroid–centroid distances = 3.7014 (8) and 3.8553 (8) Å] and weak C–H···O hydrogen bonds, forming a three-dimensional supramolecular architecture.

Keywords: crystal structure; naphthalene diimide; transistors; organic supramolecular solids; hydrogen bonding; π – π stacking.

Crystal structure of *N,N'*-bis[(pyridin-4-yl)methyl]naphthalene diimide

Mariana Nicolas-Gomez, Diego Martínez-Otero and Alejandro Dorazco-González

S1. Comment

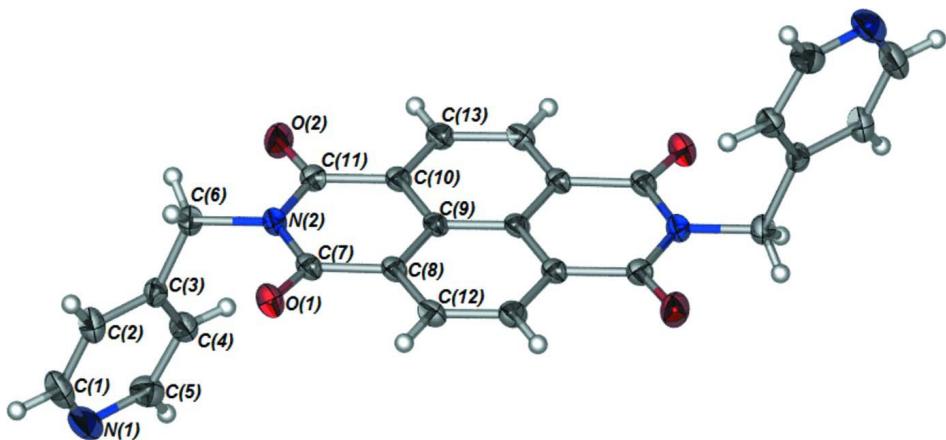

The assembly of organic molecules in solid state has attracted much attention in supramolecular chemistry, especially in crystal engineering and materials science (Cheney *et al.*, 2007). The study and understanding of intermolecular interactions in a crystal is a central topic for design and synthesis of functional organic materials with desirable optical, electronic and structural properties (Pandeeswar *et al.*, 2014). Herein we report the crystal structure of the title compound, which was prepared from 1,4,5,8-naphthalene dianhydride and 4-aminomethyl-pyridine under reflux in dry DMF. Suitable single-crystals for X-ray diffraction, were obtained directly from reaction mixture after of 12 h. The compound with methanol solvate (1:1) has been reported (Li *et al.*, 2009) and was obtained as by-product during preparation of transition polymeric complexes in a mixture (methanol:chloroform) under solvothermal conditions, structurally this solvated is similar to compound reported here, both *trans* conformation of *N*-(4-pyridilmethyl) groups as to the dihedral angles between central ring and pyridil groups (86.34°). The title compound has also been studied as a semi-rigid ditopic ligand to the synthesis of one-dimensional coordination polymers with Zn(II), Mn(II), Co(II), Cd(II) where the ligand plays the key role to determine the final conformation of the polymeric structures (Li *et al.*, 2011, 2012). The coordination of (I) to the salts of ZnCl₂, Zn(ClO₄)₂, Zn(CF₃SO₃)₂ generates one-dimensional polymeric structures where *trans* conformation of (I) is maintained and not significant structural changes observed. A series of one-dimensional metal-organic frameworks of Mn(SCN)₂, Co(SCN)₂ and Cd(SCN)₂ with (I) have been reported, in all cases (I) shows a *Z* mode conformation and links up two metal centers such that one-dimensional chains are formed with π - π stacking interactions (centroid-centroid distances = 3.92–4.14 Å).

S2. Experimental

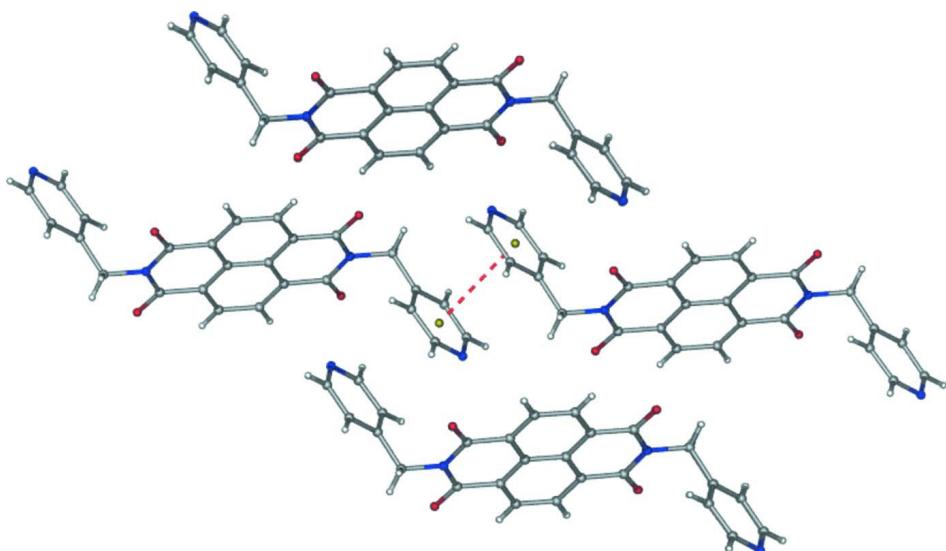

All chemicals were acquired commercially and were used without further purification. A mixture of 1,4,5,8-naphthalene dianhydride (1.0 g, 0.005 mol) and 4-aminomethyl-pyridine (1.08 g, 0.01 mol) in dry DMF (35 ml) was heated under reflux in atmosphere of dinitrogen and stirring for 2 h. Afterwards the resulting yellow solution was cooling and pallid yellow crystals were obtained on the wall of the flask directly from the mixture which corresponds to the compound I pure according to ¹H NMR in DMSO-d₆. Yield: 95%. Elemental analysis calculated (%) for C₂₆H₁₆N₄O₄; C, 69.64; H, 3.60; N, 12.49; found: C, 69.60; H, 3.62; N, 12.45.

S3. Refinement

H atoms were placed in calculated positions with C—H = 0.93–0.97 Å, and refined in riding mode with U_{iso}(H) = 1.2U_{eq}(C).

**Figure 1**

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
