The title molecule, $[Ir(C_{14}H_{14}FN_2O)_2(C_5H_7O_2)]$, is located on a twofold rotation axis, which passes through the Ir^{III} atom and the central C atom of the pentane-2,4-dionate anion. The Ir^{III} atom adopts a distorted octahedral coordination geometry, being *C,N*-chelated by two 2-*tert*-butoxy-6-fluoro-3-(pyridin-2-yl)-pyridin-4-yl ligands and *O,O'*-chelated by the pentane-2,4-dionate ligand. The bipyridinate ligands, which are perpendicular to each other [dihedral angle between the two least-squares planes = 89.95 (5) $^\circ$], are arranged in a *cis-C,C'* and *trans-N,N'* fashion relative to the central metal cation. Intramolecular C—H \cdots O and C—H \cdots N hydrogen bonds and intermolecular C—H \cdots F hydrogen bonds as well as π — π interactions between neighbouring pyridine rings [centroid–centroid distance 3.680 (1) \AA] contribute to the stabilization of the molecular and crystal structure, respectively.

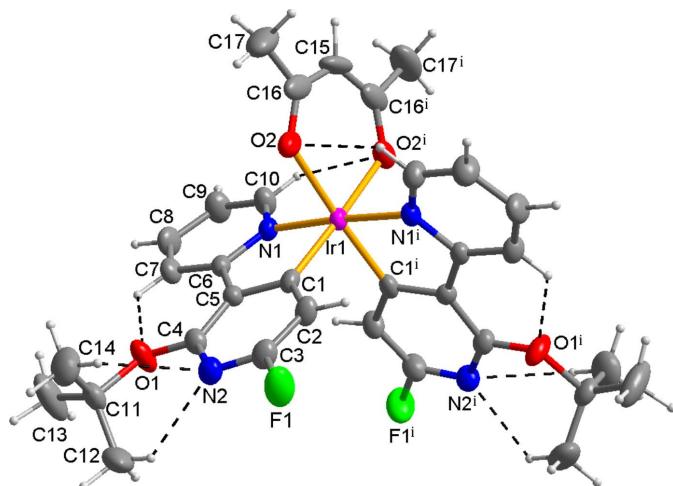

1. Chemical context

Iridium(III) compounds with fluorinated main dipyridyl ligands have attracted much attention due to their colour purity and high external quantum efficiency in organic light-emitting diodes (Lee *et al.*, 2009; Park *et al.*, 2013). In particular, heteroleptic Ir^{III} compounds have many advantages such as easy tuning of emission energies and photophysical properties by modification of the ancillary ligands (Oh *et al.*, 2013). Herein, we report the results of the crystal-structure determination of an iridium(III) compound, $[Ir(C_{14}H_{14}FN_2O)_2(C_5H_7O_2)]$, with acetylacetone (acac, *O,O'*) as an ancillary ligand.

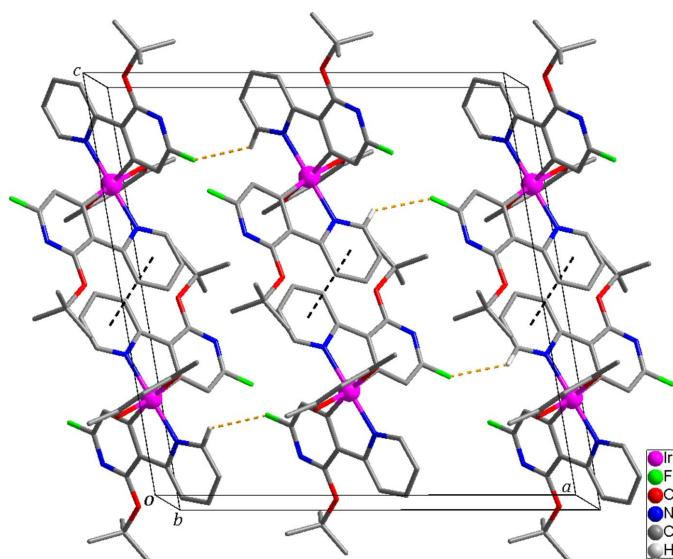

2. Structural commentary

The molecular structure of the title compound, Fig. 1, is generated by twofold rotation symmetry. The twofold rotation

**Figure 1**

View of the molecular structure of the title compound, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level; dashed lines represent intramolecular C—H···O and C—H···N hydrogen bonds [Symmetry code: (i) $-x, y, \frac{3}{2} - z$].

axis passes through the Ir^{III} atom and the central C atom (C15) of the acetylacetone ligand. Therefore, the asymmetric unit consists of one Ir(III) atom on Wyckoff position 4e, one half of the acetylacetone anion and one 2-*tert*-butoxy-6-fluoro-3-(pyridin-2-yl)pyridin-4-yl ligand. The Ir^{III} atom is six-coordinated by the two main C,N-bidentate ligands and one ancillary O,O'-bidentate ligand, forming a distorted octahedral coordination sphere due to the narrow ligand bite angles, which range from 80.36 (7) to 88.65 (8)°. The C,N-bidentate ligands, which are perpendicular to each other [dihedral angle between the least-squares planes = 89.95 (5)°], are arranged in

a *cis*-C,C' and *trans*-N,N' fashion. The Ir—C bond length of 1.9760 (19) Å is shorter than the Ir—N bond length of 2.0344 (16) Å due to the electronegative fluorine substituent (Table 1). The Ir—C, Ir—N, and Ir—O bond lengths are in normal ranges as reported for similar Ir^{III} compounds, *e.g.* [Ir(dfppy)₂(acac); dfppy is a difluorinated bipyridine] (Kang *et al.*, 2013) or Ir(2',6'-bis(2-methoxyethoxy)-2,3'-bipyridinato-N,C')(picolinate) (Frey *et al.*, 2014). Within the C,N-bidentate ligand of the title compound, the two pyridine rings are approximately co-planar, with a dihedral angle between the rings of 5.77 (9)°.

3. Supramolecular features

The molecular structure is stabilized by weak intramolecular C—H···O and C—H···N hydrogen bonds (Table 2). Intermolecular C—H···F hydrogen bonds and π — π interactions [$Cg1-Cg1^{iii} = 3.680(1)$ Å, $Cg1$ is the centroid of the N1, C6–C10 ring, symmetry code: (iii) $-x, 1 - y, 2 - z$] contribute to the stabilization of the crystal structure (Fig. 2).

4. Synthesis and crystallization

The title compound was synthesized according to a previous report (Oh *et al.*, 2013). Yellow single crystals were obtained by slow evaporation from a dichloromethane/hexane solution.

5. Refinement

Crystal data, data collection and crystal structure refinement details are summarized in Table 3. All H atoms were positioned geometrically and refined using a riding model, with $d(C-H) = 0.95$ Å, $U_{iso}(H) = 1.2U_{eq}(C)$ for Csp^2 H atoms, and 0.98 Å, $U_{iso}(H) = 1.5U_{eq}(C)$ for methyl protons.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
