Received 28 October 2014; accepted 5 November 2014

Edited by W. T. A. Harrison, University of Aberdeen, Scotland

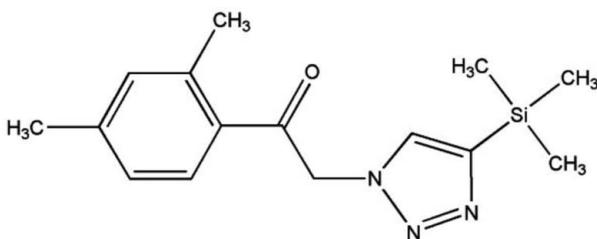

The asymmetric unit of the title compound, $C_{15}H_{21}N_3OSi$, contains two molecules with similar conformations (r.m.s. overlay fit for the 20 non-H atoms = 0.163 Å). The dihedral angles between the planes of the 1,2,3-triazole and 2,4-dimethylbenzene rings are 27.0 (3) and 19.5 (3)°. In the crystal, molecules are linked by very weak C—H···O and C—H···N hydrogen bonds to generate [100] chains. The chains are cross-linked by C—H···π interactions.

Keywords: crystal structure; 1,2,3-triazole; trimethylsilyl; hydrogen bonding; C—H···π interactions.

Crystal structure of 1-(2,4-dimethylphenyl)-2-(4-trimethylsilyl-1*H*-1,2,3-triazol-1-yl)ethanone

G. B. Venkatesh, H. Nagarajaiah, N. L. Prasad, S. HariPrasad and Noor Shahina Begum

S1. Comment

The title compound crystallizes in the triclinic crystal system with space group *P*-1 containing two molecules in the asymmetric unit. The 1,2,3-triazole ring is planar and it is substituted with trimethylsilyl group at one end. The silicon atom has almost tetrahedral coordination with the Si—C distances having characteristic values of 1.848 Å on average. On the other hand, the ring is bridged with 2,4-dimethylbenzene ring through methylenecarbonyl group with a dihedral angle of 27.00 (2)°. The methylene bridged carbonyl group at N1B adopts *cis* configuration with respect to N1=C3B bond because of intramolecular hydrogen bond between carbonyl group of ketone and methyl substituent at C6B along with C3B—H3B of triazole. This locks the molecular conformation and eliminates conformational flexibility. For crystal structure related to the title compound, see: Begum *et al.* (2004) & Islor *et al.* (2012).

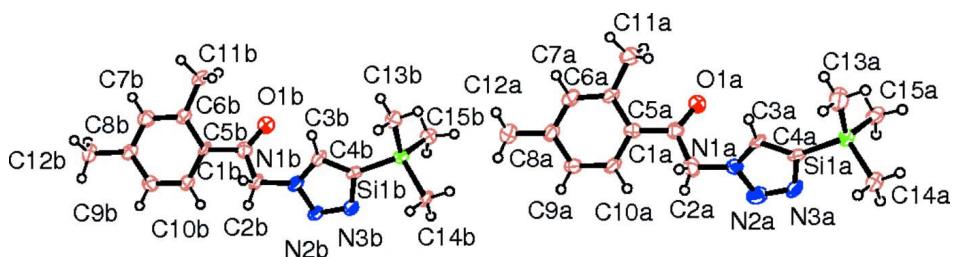

The crystal structure of the compound features C—H···O and C—H···N interactions. Both C11B—H11D···O1B and C2B—H2B1···N3B interactions resulted in zigzag one dimensional chain (Figure 2). The crystal structure also features C—H···π interaction of the type C12B—H12F···Cg (Cg is the centroid of phenyl ring C5B—C10B) 2.59 Å (Table 1).

S2. Experimental

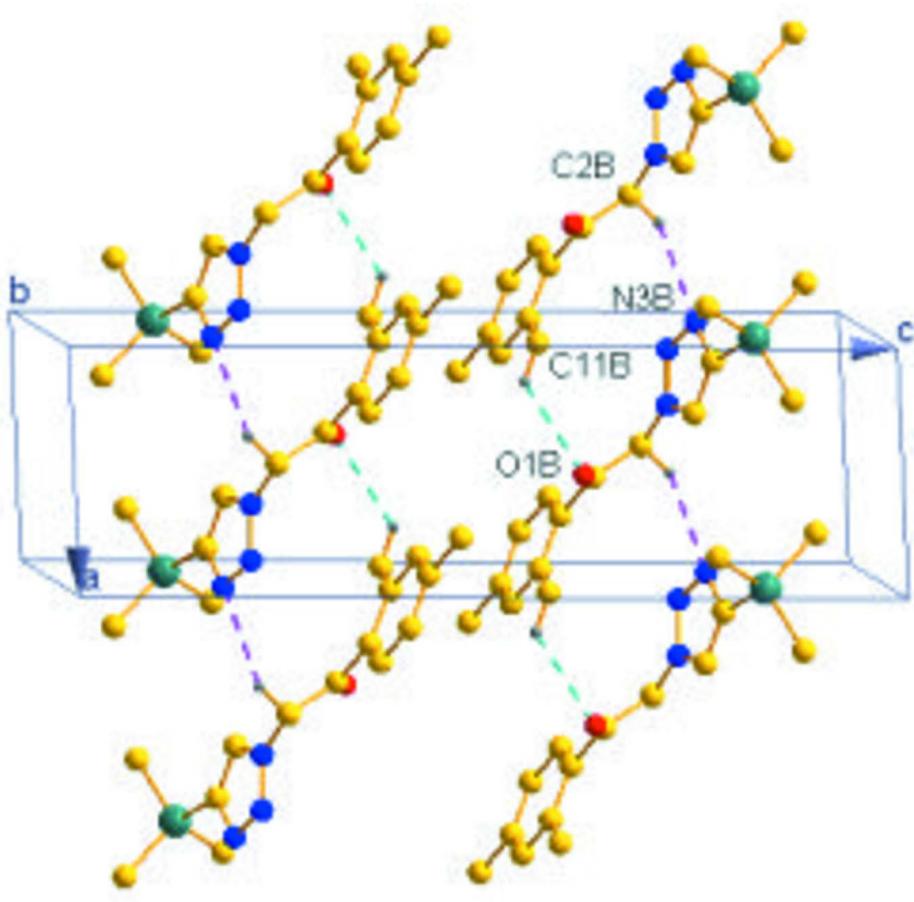

To a solution of 2-bromo-1-(2,4-dimethylphenyl)ethanone (1 mmol), sodium azide (1.5 mmol) and trimethylsilylacetylene (1.2 mmol) in 30 ml Acetone/H₂O (1:1 *v/v*) was added Cu(OAc)₂, H₂O (15 mol%) and sodium ascorbate (30 mol%). The mixture was subjected to ultrasonication for 60 min at room temperature. After completion of the reaction, as indicated by TLC, the reaction mixture was extracted with ethyl acetate. The combined organic layer was washed with brine solution. The organic layer was dried over anhydrous Na₂SO₄. The solvent was removed *in vacuo* and the residue was purified by column chromatography to isolate the title compound. Colourless blocks were grown from ethyl acetate solution; Yield: 92%; m.p: 379–381 K; FT-IR (KBr, cm⁻¹): 2960 (C—H), 1706 (C=O), 1610 (C=C), 1251 (Si—C); ¹H NMR (400 MHz, DMSO-d₆): δ 0.27 (s, 9H), 2.34 (s, 3H), 2.41 (s, 3H), 6.02 (s, 2H), 7.22–7.20 (d, *J* = 8.1 Hz, 2H), 7.95 (s, 1H), 8.07 (s, 1H); ¹³C NMR (400 MHz, CDCl₃): δ -1.1, 21.4, 21.8, 56.0, 126.7, 129.1, 130.7, 130.8, 133.6, 140.5, 144.0, 146.8, 192.2; ESI-MS *m/z*: 288 [M+H]⁺.

S3. Refinement

The H atoms were placed at calculated positions in the riding model approximation with C—H = 0.95, 0.98, and 0.99 Å for aryl, methyl, and methylene H-atoms respectively, with *U*_{iso}(H) = 1.5*U*_{eq}(C) for methyl H atoms and *U*_{iso}(H) = 1.2*U*_{eq}(C) for other H atom.

**Figure 1**

ORTEP view of the title compound, showing 50% probability ellipsoids.

**Figure 2**

The unit cell packing of the title compound, showing C—H···O and C—H···N interactions. H-atoms not involved in hydrogen bonding have been excluded.

 $\Delta\rho_{\min} = -0.67 \text{ e \AA}^{-3}$

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg1 is the centroid of the C5B—C10B ring.

D—H···A	D—H	H···A	D···A	D—H···A
C11B—H11D···O1B ⁱ	0.98	2.67	3.358 (5)	128
C2B—H2B1···N3B ⁱ	0.99	2.66	3.418 (7)	134
C12B—H12F···Cg1 ⁱⁱ	0.98	2.59	3.446 (4)	146

Symmetry codes: (i) $x+1, y, z$; (ii) $-x-4, -y+4, -z-1$.
