In the title compound, $[UO_2(C_5H_7O_2)_2(C_{14}H_{15}N)]$, the uranyl(VI) unit ($[O=U=O]^{2+}$) is coordinated to two acetylacetone (acac) anions and one 1-phenyl-3-(pyridin-4-yl)propane (ppp) molecule. The geometry around the U atom is UNO_6 pentagonal-bipyramidal; two uranyl(VI) O atoms are located at the axial positions, whereas four O atoms from two chelating bidentate acac ligands and one N atom of a ppp ligand form the equatorial plane.

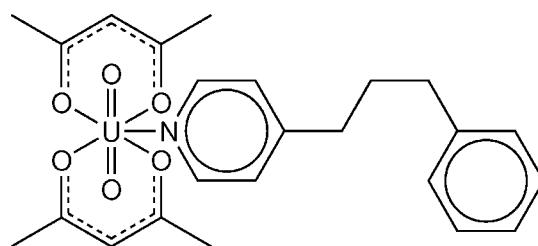

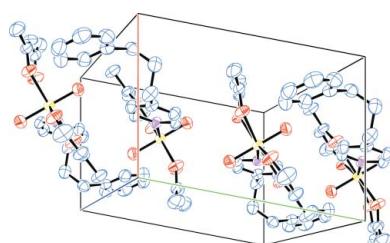

Keywords: crystal structure; pentane-2,4-dionate; 1-phenyl-3-(pyridin-4-yl)propane; uranium(VI) complex

1. Chemical context

The structural properties of uranyl(VI) complexes are interesting from the viewpoint of nuclear fuels reprocessing and actinide waste treatment. In most commercial reprocessing plants, spent nuclear fuels are treated by the Purex method, in which uranium and plutonium are extracted from a nitric acid solution of spent nuclear fuels using tributyl-phosphate/*n*-dodecane. Uranium in the nitric acid solution exists as uranyl(VI) ($[O=U=O]^{2+}$) complexes. However, the Purex method has a few problems; for example, as the processing takes place on a relatively large scale, a large amount of extractant is necessary (Ikeda *et al.*, 2004; Suzuki *et al.*, 2012). Attempts to find other suitable coordinating ligands are therefore being undertaken. A number of structural studies of uranyl(VI) β -diketonate complexes have been reported by ourselves and others (Alcock *et al.*, 1984, 1987; Huusonen *et al.*, 2007; Kannan *et al.*, 2001; Kawasaki & Kitazawa, 2008; Kawasaki *et al.*, 2010; Sidorenko *et al.*, 2009; Tahir *et al.*, 2006; Takao & Ikeda, 2008). In particular, acetylacetone (acac), is the simplest β -diketonate ligand and an important coordinating ligand for uranium.

We report herein the synthesis and crystal structure of a novel uranyl(VI) acetylacetone (acac) complex with the pyridine-based ligand ppp [ppp = 1-phenyl-3-(pyridin-4-yl)propane] (Seth, 2014), namely, $[UO_2(acac)_2(ppp)]$.

2. Structural commentary

The title compound of formula $[\text{UO}_2(\text{C}_5\text{H}_7\text{O}_2)_2(\text{C}_{14}\text{H}_{15}\text{N})]$, is constructed from one uranyl(VI) ($[\text{O}=\text{U}=\text{O}]^{2+}$) unit, two acetylacetone anions and one molecule of ppp (Fig. 1). The uranium(VI) atom exhibits a pentagonal-bipyramidal coordination geometry: two uranyl(VI) oxygen atoms (O1 and O2) are located in the axial positions and four oxygen atoms (O3, O4, O5 and O6) from two chelating bidentate acac ions, together with one nitrogen atom (N1) of the ppp molecule, form the equatorial plane. The bond lengths around U1 (Table 1) decrease in the order $\text{U}-\text{N} > \text{U}-\text{O}_{\text{acac}} > \text{U}=\text{O}$. The dihedral angle between the pyridine ring of the ppp molecule and the equatorial plane around U1 is $49.43(12)^\circ$. The above structural properties are similar to those in the majority of previously characterised $[\text{UO}_2(\text{acac})_2L]$ (L = pyridine derivative ligand) complexes (Alcock *et al.*, 1984; Kawasaki & Kitazawa, 2008; Kawasaki *et al.*, 2010). The conformation of the ppp molecule is GG' (Fig. 2). The dihedral angle between the pyridine ring and the phenyl ring in the ppp molecule is $26.96(13)^\circ$.

**Figure 2**

The four possible conformations that the ppp ligand can form (based on Carlucci *et al.*, 2002). In the title compound, the conformation is GG' .

3. Supramolecular features

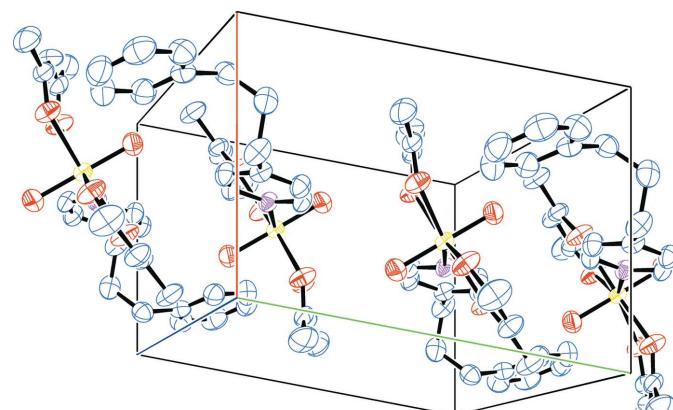

A packing diagram of title complex is shown in Fig. 3. The molecules are stacked along the b axis, held together by van der Waals' interactions only. Significant intermolecular $\pi-\pi$ and C–H $\cdots\pi$ interactions are not found.

4. Synthesis and crystallization

The title complex was synthesized according to literature procedures (Alcock *et al.*, 1984, 1987; Kawasaki & Kitazawa, 2008; Kawasaki *et al.*, 2010). To 10 ml of a methanolic solution containing 1 mmol $\text{UO}_2(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ was added 3 mmol of acetylacetone and 3 mmol of 1-phenyl-3-(pyridin-4-yl)-propane in 5 ml MeOH. The solvent evaporated slowly at room temperature for a few days and orange crystal were obtained.

5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. All H atoms were placed at calculated positions [$\text{C}(\text{CH})-\text{H} = 0.93$, $\text{C}(\text{CH}_2)-\text{H} = 0.97$ and $\text{C}(\text{CH}_3)-\text{H} = 0.96\text{\AA}$] and allowed to ride on their parent atoms with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{CH}, \text{CH}_2)$ and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{CH}_3)$.

**Figure 3**

A packing diagram of the title complex (red line: a axis; green line: b axis; blue line: c axis). Displacement ellipsoids are drawn at the 50% probability level and H atoms have been omitted for clarity.

$$\Delta\rho_{\min} = -0.64 \text{ e \AA}^{-3}$$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
