The title compound, $\mathrm{C}_{21} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3}$, has an $E$ conformation about the azomethine double bond. The central moiety of the hydrazinecarboxamide moiety [ $-\mathrm{N}-$ $\mathrm{N}-\mathrm{C}(=\mathrm{O})-\mathrm{N}-$ ] has an almost coplanar arrangement [maximum deviation for the C atom $=0.010(2) \AA$ ]. This central moiety is flanked by three aromatic rings and its mean plane makes dihedral angles of 24.7 (1), 72.91 (12) and 34.26 (11) Å, respectively, with the phenolic ring, the phenyl ring attached to the same C atom as the phenolic ring, and the phenylhydrazine ring. The adjacent phenolic and phenyl rings are twisted away from each other to reduce steric hindrance and make a dihedral angle of $80.59(12)^{\circ}$. The phenolic and phenylhydrazine rings are inclined to one another by 28.89 (11) ${ }^{\circ}$. The rigidity of the molecule is increased by an intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond involving the phenolic hydrogen and the azomethine N atom. In the crystal, the carbonyl O atom forms bifurcated hydrogen bonds with the two NH atoms of the hydrazinic group, leading to the formation of chains propagating along [001]. Within the chains there are also $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds present. The chains are linked via $\mathrm{C}=\mathrm{O} \cdots \pi[3.4316$ (18) $\AA$ ] and parallel slipped $\pi-\pi$ interactions, involving inversion-related benzene rings [centroid-centroid distance = 3.8850 (14) $\AA$; inter-planar distance $=3.3895(10) \AA$; slippage $=1.899 \AA$ ], forming sheets lying parallel to (100).

## 1. Chemical context

Semicarbazones are urea derivatives exhibiting a wide spectrum of biological activities (Beraldo \& Gambino, 2004). They have been found to be associated with antitumoral (Afrasiabi et al., 2005), antimicrobial (Siji et al., 2010), antihypertensive, hypolipidemic, antineoplastic, hypnotic and anticonvulsant properties. They can function as excellent ligands to various metal ions (Kala et al., 2007; Aiswarya et al., 2013; Kurup et al., 2011) and can coordinate to metal ions either in the neutral (Siji et al., 2011) or in the anionic forms (Reena et al., 2008). Single crystals of acetophenone semicarbazones are potential organic non-linear optical (NLO) materials and they have a wide transparency window in the entire visible region, making them ideal candidates for NLO device applications (Vijayan et al., 2001). Semicarbazones have been proposed as analytical reagents that can be used in selective and sensitive determination of metal ions (Garg \& Jain, 1988). The crystal structure of the dimethylformamide solvate of the title compound has been reported (Annie et al., 2012).

## 2. Structural commentary

In the molecule of the title compound (Fig. 1), the conformation about the $\mathrm{C} 7=\mathrm{N} 1$ bond is $E$, and the central hydrazinecarboxamide moiety $[-\mathrm{N} 1-\mathrm{N} 2-\mathrm{C} 14(=\mathrm{O} 3)-\mathrm{N} 3-]$ is almost planar [the maximum deviation is 0.010 (2) $\AA$ for atom C14]. This central moiety is flanked by three aromatic rings (C1-C6, C8-C13 and C15-C20) which are inclined to its mean plane by 24.70 (10), 72.91 (12) and 34.26 (11) ${ }^{\circ}$, respectively. Rings C1-C6 and C8-C13, attached at the same C atom (C7), are twisted away from each other and make a dihedral angle of $80.59(12)^{\circ}$. They are inclined to the phenylhydrazine ring

Figure 1
A view of the molecular structure of the title compound, with the atom labelling. Displacement ellipsoids are drawn at the $50 \%$ probability level.

Figure 2
A view of the hydrogen-bonding interactions (dashed lines) in the title compound, forming chains propagating along [001] (see Table 1 for details).

Table 1
Hydrogen-bond geometry ( $\mathrm{A},{ }^{\circ}$ ).

| $D-\mathrm{H} \cdots A$ | $D-\mathrm{H}$ | $\mathrm{H} \cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{O} 2-\mathrm{H} 2 O \cdots \mathrm{~N} 1$ | $0.89(1)$ | $1.76(2)$ | $2.563(2)$ | $149(3)$ |
| $\mathrm{N} 2-\mathrm{H} 2 N \cdots 3^{\mathrm{i}}$ | $0.87(1)$ | $2.13(1)$ | $2.9301(19)$ | $152(2)$ |
| $\mathrm{N} 3-\mathrm{H} 3 N \cdots \mathrm{O}^{\mathrm{i}}$ | $0.88(1)$ | $2.09(1)$ | $2.935(2)$ | $161(2)$ |
| $\mathrm{C}_{12}-\mathrm{H} 12 \cdots \mathrm{O}^{\mathrm{ii}}$ | 0.93 | 2.44 | $3.252(3)$ | 146 |

Symmetry codes: (i) $x,-y+\frac{3}{2}, z-\frac{1}{2}$; (ii) $x, y, z-1$.
(C15-C20) by 28.89 (11) and 52.42 (12) ${ }^{\circ}$, respectively. In the crystal structure of the dimethylformamide solvate of the title compound (Annie et al., 2012), the two rings attached at the same C atom (C7) are inclined to one another by 88.47 (10) ${ }^{\circ}$, while they are inclined to the phenylhydrazine ring by $14.42(10)^{\circ}$ for the phenolic ring, and by $82.35(11)^{\circ}$ for the phenyl ring. There is an intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond (Fig. 2) involving the phenolic hydrogen and the azomethine atom N1 (Fig. 2 and Table 1). This hydrogen bond is also present in the structure of the dimethylformamide solvate of the title compound mentioned above.

## 3. Supramolecular features

In the crystal, the carbonyl O atom (O3) acts as the acceptor in bifurcated hydrogen bonds with the NH atoms of atoms N 2 and N3 of the hydrazinic group, leading to the formation of chains propagating along [001]; Table 1 and Fig. 2. Within the chains there are also $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds present (Table 1 and Fig. 2). The chains are linked via $\mathrm{C} 14=\mathrm{O} 3 \cdots \pi$ interactions [distance $\mathrm{O} 3 \cdots C g^{\mathrm{i}}=3.4316(18) \AA$; angle $\mathrm{C} 14=\mathrm{O} 3 \cdots C g=95.3(1)^{\circ} ; C g$ is the centroid of the $\mathrm{C} 8-\mathrm{C} 13$ ring; symmetry code: (i) $\left.x,-y+\frac{3}{2}, z+\frac{1}{2}\right]$, as shown in Fig. 3.

Figure 3
$\mathrm{C}=\mathrm{O} \cdots \pi$ interaction in the crystal structure of the title compound.

Figure 4
$\pi-\pi$ interaction in the crystal structure of the title compound.

There are also parallel slipped $\pi-\pi$ interactions present (Fig. 4), involving inversion-related benzene rings (C15-C20) with a centroid-centroid distance of $3.8850(14) \AA$ [interplanar distance $=3.3895(10) \AA$; slippage $=1.899 \AA]$. The result of these interactions leads to the formation of sheets lying parallel to (100), as shown in Fig. 5.

## 4. Synthesis and crystallization

To a warm methanolic solution ( 25 ml ) of $N^{4}$-phenylsemicarbazide ( $0.302 \mathrm{~g}, 2 \mathrm{mmol}$ ), a methanolic solution ( 25 ml ) of 2-hydroxy-4-methoxybenzophenone ( $0.4566 \mathrm{~g}, 2 \mathrm{mmol}$ ) was added and the resulting solution was boiled under reflux for 2 h , after adding three drops of conc. HCl . On slow evaporation at room temperature, colourless crystals separated out. They were filtered off and washed with methanol and ether. Single crystals of the title compound suitable for X-ray analysis were obtained by slow evaporation of a solution in methanol (yield: $0.1735 \mathrm{~g}, 76 \%$; m.p.: 498 K ). FT-IR ( KBr , $\left.\mathrm{cm}^{-1}\right) \nu_{\text {max }}: 3316(\mathrm{~s}, \mathrm{OH}), 3249(\mathrm{~m}, \mathrm{NH}), 3145(\mathrm{~m}, \mathrm{NH}), 1662(\mathrm{~s}$, $\mathrm{C}=\mathrm{O}), 1631(\mathrm{~m}, \mathrm{C}=\mathrm{N}), 1059(\mathrm{~m}, \mathrm{~N}-\mathrm{N}) .{ }^{1} \mathrm{H}$ NMR (DMSO- $\mathrm{d}_{6}$,

## 5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The OH and NH H atoms were located in a difference Fourier map and refined with distances restraints of 0.88 (1) A. The C-bound H atoms were placed in calculated positions and refined as riding atoms: $\mathrm{C}-\mathrm{H}=0.93-$ $0.96 \AA$ with $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C})$ for methyl H atoms and $1.2 U_{\text {eq }}(\mathrm{C})$ for other H atoms.

## Acknowledgements

CFA is thankful to the University Grants Commission, Bangalore, India, for the award of a Teacher Fellowship under the faculty improvement programme. MRPK is grateful to UGC, New Delhi, India, for a UGC-BSR one-time grant to the Faculty. We also thank the Sophisticated Analytical Instruments Facility, Cochin University of S \& T, Kochi-22, India, for the diffraction measurements.

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R -factor wR and goodness of fit S are based on $\mathrm{F}^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating R-factors (gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger.
