In the title polymeric compound, $\left[\mathrm{Co}\left(\mathrm{C}_{8} \mathrm{H}_{5} \mathrm{O}_{3}\right)_{2}\left(\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{~N}_{2}\right)\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]_{n}$, the $\mathrm{Co}^{\text {II }}$ atom is located on a twofold rotation axis and has a slightly distorted octahedral coordination sphere. In the equatorial plane, it is coordinated by two carboxylate O atoms of two symmetry-related monodentate formylbenzoate anions and by two N atoms of two bridging pyrazine ligands. The latter are bisected by the twofold rotation axis. The axial positions are occupied by two O atoms of the coordinating water molecules. In the formylbenzoate anion, the carboxylate group is twisted away from the attached benzene ring by $7.50(8)^{\circ}$, while the benzene and pyrazine rings are oriented at a dihedral angle of $64.90(4)^{\circ}$. The pyrazine ligands bridge the $\mathrm{Co}^{\mathrm{II}}$ cations, forming linear chains running along the $b$-axis direction. Strong intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the water molecules to the carboxylate $O$ atoms. In the crystal, weak $\mathrm{O}-\mathrm{H}_{\text {water }} \cdots \mathrm{O}_{\text {water }}$ hydrogen bonds link adjacent chains into layers parallel to the $b c$ plane. The layers are linked via $\mathrm{C}-\mathrm{H}_{\mathrm{pyrazine}} \cdots \mathrm{O}_{\text {formyl }}$ hydrogen bonds, forming a three-dimensional network. There are also weak $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions present.

## 1. Chemical context

The structural functions and coordination relationships of the arylcarboxylate ion in transition metal complexes of benzoic acid derivatives change depending on the nature and position of the substituent groups on the benzene ring, the nature of the additional ligand molecule or solvent, and the medium of the synthesis (Adiwidjaja et al., 1978; Antsyshkina et al., 1980; Nadzhafov et al., 1981; Shnulin et al., 1981). Transition metal complexes with biochemically active ligands frequently show interesting physical and/or chemical properties and, as a result, they may find applications in biological systems (Antolini et al., 1982). Some benzoic acid derivatives, such as 4-aminobenzoic acid, have been extensively reported in coordination chemistry, as bifunctional organic ligands, due to the varieties of their coordination modes (Chen \& Chen, 2002; Amiraslanov et al., 1979; Hauptmann et al., 2000).

In this context, we report the synthesis and crystal structure of the title compound, $\left[\mathrm{Co}\left(\mathrm{C}_{8} \mathrm{H}_{5} \mathrm{O}_{3}\right)_{2}\left(\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{~N}_{2}\right)\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]_{n}$, which is isotypic with its $\mathrm{Cu}^{\mathrm{II}}$ (Çelik et al., 2014a) and $\mathrm{Ni}^{\mathrm{II}}$ (Çelik et al., 2014b) analogues.

## 2. Structural commentary

The asymmetric unit of the title compound contains a $\mathrm{Co}^{\mathrm{II}}$ ion, one formylbenzoate (FB) anion, one water molecule and half of a pyrazine molecule. Atoms N1 and N2 of the pyrazine
ligand and Co 1 are located on a twofold rotation axis (Fig. 1). The pyrazine ligands bridge adjacent $\mathrm{Co}^{\mathrm{II}}$ ions, forming polymeric chains running along the $b$-axis direction (Fig. 2). The distance between symmetry-related $\mathrm{Co}^{\text {II }}$ ions [Co1 $\cdots \mathrm{Co}^{1 \mathrm{iii}}$; symmetry code: (iii) $\left.x, y+1, z\right]$ is 7.1193 (4) $\AA$.

The equatorial plane of the $\mathrm{Co}^{\mathrm{II}} \mathrm{O}_{4} \mathrm{~N}_{2}$ coordination sphere is composed of two carboxylate O atoms [ O 1 and $\mathrm{O} 1^{\mathrm{i}}$; symmetry code: (i) $\left.2-x, y, \frac{3}{2}-z\right]$ of two symmetry-related monodentate formylbenzoate anions and two N atoms [ N 1 and $\mathrm{N} 2^{\text {ii; }}$; symmetry code: (ii) $x,-1+y, z$ ] of two bridging pyrazine ligands, which are bisected by the twofold rotation axis. The axial positions are occupied by two O atoms ( O 4 and $\mathrm{O} 4^{\mathrm{i}}$ ) of the coordinating water molecules.

Figure 1
A view of the coordination environment around the $\mathrm{Co}^{\mathrm{II}}$ atom of the title molecule, showing the atom labelling. Displacement ellipsoids are drawn at the $50 \%$ probability level. The twofold rotation axis bisects atoms Co1, N 1 and N 2 . Non-labelled atoms are generated by the symmetry code $-x+2, y,-z+\frac{3}{2}$.

Table 1
Hydrogen-bond geometry ( $\mathrm{A}^{\circ}{ }^{\circ}$ ).
$C g 1$ is the centroid of ring $A(\mathrm{C} 2-\mathrm{C} 7)$.

| $D-\mathrm{H} \cdots A$ | $D-\mathrm{H}$ | $\mathrm{H} \cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
| :--- | :--- | :--- | :--- | :--- |
| O4-H41 $\cdots \mathrm{O} 2$ | $0.89(3)$ | $1.72(3)$ | $2.5909(16)$ | $164(2)$ |
| O4-H42 $\mathrm{O}^{\mathrm{i}}$ | $0.71(3)$ | $2.63(3)$ | $2.958(2)$ | $111(2)$ |
| C10-H10 ${ }^{\mathrm{ii}}$ O3 | 0.93 | 2.46 | $3.320(2)$ | 154 |
| C7-H7 $\cdots$ Cg1 $^{\mathrm{iii}}$ | 0.93 | 2.65 | $3.4216(15)$ | 142 |

Symmetry codes: (i) $-x+2,-y,-z+1$; (ii) $-x+\frac{3}{2},-y+\frac{1}{2},-z+2$; (iii) $x,-y, z-\frac{1}{2}$.

The near equality of the $\mathrm{C} 1-\mathrm{O} 1[1.272(2) \AA$ A C and $\mathrm{C} 1-\mathrm{O} 2$ [1.245 (2) A $]$ bonds in the carboxylate group indicates a delocalized bonding arrangement, rather than localized single and double bonds. The $\mathrm{Co}-\mathrm{N}$ bond length is 2.165 (9) $\AA$, while the $\mathrm{Co}-\mathrm{O}$ bond lengths are 2.0551 (9) $\AA$ (for benzoate oxygen) and 2.1491 (11) $\AA$ (for water oxygen), close to standard values. The Co1 atom is displaced by 0.1034 (2) $\AA$ from the mean plane of the carboxylate group ( $\mathrm{O} 1 / \mathrm{C} 1 / \mathrm{O} 2$ ). The dihedral angle between the carboxylate group and the adjacent benzene ring $A(\mathrm{C} 2-\mathrm{C} 7)$ is $7.50(8)^{\circ}$, while the benzene and pyrazine rings are oriented at a dihedral angle of $64.90(4)^{\circ}$.

## 3. Supramolecular features

Strong intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 1) link the water molecules to the non-coordinating carboxylate oxygen atoms. In the crystal, weak $\mathrm{O}-\mathrm{H}_{\text {water }} \cdots \mathrm{O}_{\text {water }}$ hydrogen bonds (Table 1) link adjacent chains into layers parallel to the $b c$ plane. The layers are linked via C $\mathrm{H}_{\text {pyrazine }} \cdots \mathrm{O}_{\text {formyl }}$ hydrogen bonds, forming a three-dimensional network (Fig. 3). There are also weak $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions present (Table 1).

Figure 2
A partial view of the crystal packing of the title compound.

Figure 3
Part of the crystal structure. Intermolecular hydrogen bonds are shown as dashed lines. Non-bonding H atoms have been omitted for clarity.

## 4. Refinement

The experimental details including the crystal data, data collection and refinement are summarized in Table 2. Atoms H 41 and H 42 (for $\mathrm{H}_{2} \mathrm{O}$ ) were located in a difference Fourier map and were refined freely. The methine H atom was also located in a difference Fourier map and the $\mathrm{C}-\mathrm{H}$ distance restrained to 0.984 (13) A. The aromatic C-bound H atoms were positioned geometrically with $\mathrm{C}-\mathrm{H}=0.93 \AA$, and constrained to ride on their parent atoms, with $U_{\text {iso }}(\mathrm{H})=$ $1.2 U_{\text {eq }}(\mathrm{C})$.

## 5. Synthesis and crystallization

The title compound was prepared by the reaction of $\mathrm{CoSO}_{4} \cdot 7 \mathrm{H}_{2} \mathrm{O}(1.40 \mathrm{~g}, 5 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(25 \mathrm{ml})$ and pyrazine $(0.40 \mathrm{~g}, 5 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(25 \mathrm{ml})$ with sodium 4-formylbenzoate $(1.72 \mathrm{~g}, \quad 10 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(70 \mathrm{ml})$ at room temperature. The mixture was filtered and set aside to crystallize at ambient temperature for one week, giving orange single crystals.

## Acknowledgements

The authors acknowledge the Aksaray University Science and Technology Application and Research Center, Aksaray, Turkey, for the use of the Bruker SMART BREEZE CCD diffractometer (purchased under grant No. 2010K120480 of the State of Planning Organization). ## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R -factor wR and goodness of fit S are based on $\mathrm{F}^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating R-factors (gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger.

Symmetry codes: (i) $-x+2, y,-z+3 / 2$; (ii) $x, y-1, z$; (iii) $x, y+1, z$.

Hydrogen-bond geometry ( $\hat{A},{ }^{\circ}$ )
Cg 1 is the centroid of ring $A$ (C2-C7).
