Edited by A. M. Chippindale, University of Reading, England

In the title compound, $\left[\mathrm{CuCl}_{2}\left(\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{NO}_{2}\right)_{2}\right]$, the square-planarcoordinated $\mathrm{Cu}^{\text {II }}$ ion lies on a centre of symmetry and is bonded to two monodentate methylisonicotinate ligands through their N atoms and by two chloride ligands. The molecules pack in a herringbone pattern. Perpendicular to [100] there are weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{Cl}$ and $\mathrm{C}-$ $\mathrm{H} \cdots \mathrm{O}$ contacts. Along [100] there are infinite chains of edgesharing octahedra linked through the chlorido ligands

Keywords: crystal structure; square-planar copper(II) complex; methyl isonicotinate.

# Crystal structure of dichloridobis(methyl isonicotinate- $\kappa \mathrm{N}$ ) copper(II) 

Elaheh Ahadi, Hassan Hosseini-Monfared and Peter Mayer

## S1. Comment

Isonicotinate is a versatile ditopic ligand that has been used for various applications. The copper(II) isonicotinate ( $\mathrm{Cu}(4-$ $\left.\left.\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{~N}-\mathrm{COO}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right)$ coordination polymer has been explored as a sorbent in flow injection solid-phase extraction for determination of trace polycyclic aromatic hydrocarbons in environmental matrices [Zhou et al. (2006)]. The incorporation of both dinuclear $\left(M_{2}\right)$ and mononuclear $\left(M^{\prime}\right)$ units into molecular squares has been achieved by reacting a triply bonded $\mathrm{Re}_{2}(\mathrm{II}, \mathrm{II})$ complex possessing two cis isonicotinate donor ligands with $\mathrm{Pt}(\mathrm{II})$ containing molecules with substitutionally labile cis trifluoromethanesulfonate groups [Bera et al. (2001)]. Quadruply bonded $\mathrm{Mo}_{2}{ }^{4+}$ species having isonicotinate ligands bound through the carboxylate group have been designed to act as 'anglers' by luring metalcontaining Lewis acids to bind to the N-pyridyl group [Cotton et al. (2007)]. The copper-isonicotinate metal-organic frameworks $\left[\mathrm{Cu}(\mathrm{INA})_{2}\right]$ (INA = isonicotinate) (MOFs) have been prepared simply by mixing and heating solid reactants without milling. The adsorption of fluorescein dye on the as-synthesized $\left[\mathrm{Cu}(\mathrm{INA})_{2}\right]$ has also been investigated [Tella $e t$ al. (2014)].
The molecular structure of the title compound possessing a crystallographic centre of inversion is depicted in Fig. 1. The first coordination sphere of the Cu 1 centre consists of two nitrogen atoms, from the isoniconate ligands, at a distance of 2.025 (2) $\AA$ and two chlorido ligands at a distance of 2.2962 (7) $\AA$. The various $\mathrm{N} 1-\mathrm{Cu} 1-\mathrm{Cl} 1$ angles are close to $90^{\circ}$ resulting in a square-planar first coordination sphere of Cu . By coordination of two additional chlorido ligands from adjacent complexes at a distance of 2.9215 (7) $\AA$ from the Cu 1 centre, the coordination sphere is expanded to a distorted octahedron. The pyridine ring and the $\mathrm{Cu} 1-\mathrm{Cl1}$ bond are not coplanar, but enclose an angle of $59.00(9)^{\circ}$. The $\mathrm{Cu}-\mathrm{N} 1$ bond and the plane of the pyridine ring deviate from coplanarity by an angle of $5.05(1)^{\circ}$.
The herringbone pattern of the packing of the title compound is shown in Fig. 2. Perpendicular to [100] there are weak intermolecular C-H $\cdots \mathrm{Cl}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ contacts with donor-acceptor distances of 3.517 (3) $\AA, 3.470$ (4) $\AA$ and 3.298 (4) $\AA$ ( $\mathrm{C} 2 \cdots \mathrm{Cl1}, \mathrm{C} 7 \cdots \mathrm{O} 2$ and $\mathrm{C} 7 \cdots \mathrm{O} 1$, respectively). Along [100] there are infinite chains of edge-sharing octahedra linked through the chlorido ligands (Fig.3). This structural feature is found in many copper complexes consisting of two chlorido ligands and two pyridine derivatives, e.g. Vitorica-Yrezabel et al. (2011), Laing et al. (1971), Chen et al. (2006), Ge et al. (2006), Chen et al. (2011), Ma et al. (2010). Each bridging chlorido ligand has a short (2.2962 (7) $\AA$ ) and a longer ( $2.9215(7) \AA$ ) bond distance to the two adjacent Cu -centers. The bond angle at the bridging chloride ions is $92.03(2)^{\circ}$. A consequence of the formation of the strands along [100] is $\pi$-stacking between adjacent pyridine rings. The average distance between the centres of gravity of adjacent rings is $a=3.7792 \AA$.

## S2. Experimental

The compound 4-(5-phenyl-1,3,4-oxadiazol-2-yl)pyridine ( $0.04 \mathrm{~g}, 0.18 \mathrm{mmol}$, synthesised by a previously reported method [Kangani et al. (2009)], and copper(II) chloride dihydrate ( $0.015 \mathrm{~g}, 0.09 \mathrm{mmol}$ ) were placed in the main arm of a branched tube. Methanol ( 13 ml ) was carefully added to fill the arms, the tube was sealed and the reagent-containing arm
immersed in an oil bath at $60^{\circ} \mathrm{C}$ while the other arm was kept at ambient temperature. After two weeks, green, needle shaped crystals were deposited in the cooler arm. The crystals were filtered, washed with methanol and air dried. Yield $19 \%$ ( 7.0 mg ).

## S3. Refinement

All hydrogen atoms were positioned geometrically and treated as riding on their parent atoms (aromatic $\mathrm{C}-\mathrm{H}=0.95 \AA$, methyl C $-\mathrm{H}=0.98 \AA, U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C}$, aromatic $), U_{\mathrm{iso}}(\mathrm{H})=1.5 U_{\mathrm{eq}}(\mathrm{C}$, methyl $)$ ). The methyl group was allowed to rotate along the $\mathrm{C}-\mathrm{O}$ bond to best fit the experimental electron density.

## Figure 1

The molecular structure of the title compound (ellipsoids drawn at the $30 \%$ probability level). Symmetry code: $\mathrm{i}=1-x$, $y, 1-z$. Non-labelled non-hydrogen atoms have been generated by symmetry i.

Figure 2
The unit cell viewed along [100] (ellipsoids drawn at the $50 \%$ probability level). Intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{Cl}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ contacts are indicated by dashed lines.

Figure 3
Infinite strands along [100] formed by intermolecular $\mathrm{Cu}-\mathrm{Cl}$ bonds (thin bond diameter) (drawn at the 30\% ellipsoid probability level).

## Special details

Experimental. Absorption correction: CrysAlisPro (Oxford Diffraction, 2011) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
