The title azastilbene derivative, $\mathrm{C}_{14} \mathrm{H}_{13} \mathrm{NO}_{2}$ \{systematic name: (E)-2-[(4methoxybenzylidene) amino]phenol\}, is a product of the condensation reaction between 4-methoxybenzaldehyde and 2-aminophenol. The molecule adopts an $E$ conformation with respect to the azomethine $\mathrm{C}=\mathrm{N}$ bond and is almost planar, the dihedral angle between the two substituted benzene rings being $3.29(4)^{\circ}$. The methoxy group is coplanar with the benzene ring to which it is attached, the $\mathrm{C}_{\text {methyl }}-\mathrm{O}-\mathrm{C}-\mathrm{C}$ torsion angle being $-1.14(12)^{\circ}$. There is an intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond generating an $S(5)$ ring motif. In the crystal, molecules are linked via $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming zigzag chains along [10 $\overline{1}]$. The chains are linked via $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions, forming a threedimensional structure.

## 1. Chemical context

Azastilbenes have been reported to possess various biological activities such as antibacterial (Tamizh et al., 2012), antioxidant (Cheng et al., 2010; Lu et al., 2012), antifungal (da Silva et al., 2011) and antiproliferative (Fujita et al., 2012) including lipoxygenase inhibitor (Aslam et al., 2012b) activities. $\mathrm{Pd}^{\mathrm{II}}$ and $\mathrm{Ru}^{\mathrm{III}}$ complexes of azastilbenes have been synthesized and some have shown potent antibacterial activity (Briel et al., 1998; Prabhakaran et al., 2008; Puthilibai et al., 2009). The interesting biological activities of azastilbenes have attracted us to synthesis a series of azastilbenes, including the title compound, and to study their antibacterial and antioxidant activities (Kaewmanee et al., 2013, 2014). The antibacterial assay for the title compound indicated that it possesses moderate to weak antibacterial activity against $B$. subtilis, $S$. aureus, $P$. aeruginosa, S. typhi and $S$. sonnei with the MIC values in the range of 37.5 to $150 \mu \mathrm{~g} / \mathrm{ml}$. In addition, it also shows interesting antioxidant activity by DPPH assay with the $\mathrm{IC}_{50}$ value of $0.080 \pm 0.0004 \mu \mathrm{~g} / \mathrm{ml}$. Herein, we report on the synthesis, spectroscopic and crystallographic characterization of the title compound.

Figure 1
The molecular structure of the title compound, with atom labelling. Displacement ellipsoids are drawn at the $60 \%$ probability level. The intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond is shown as a dashed line (see Table 1).

## 2. Structural commentary

The title azastilbene compound (Fig. 1) has an $E$ conformation about the azomethine $\mathrm{C} 7=\mathrm{N} 1$ double bond $[1.2825$ (10) $\AA$ A], the $\mathrm{C} 8-\mathrm{N} 1-\mathrm{C} 7-\mathrm{C} 1$ torsion angle being $-178.67(8)^{\circ}$. The molecule is almost planar with a dihedral angle of $3.29(4)^{\circ}$ between the two substituted benzene rings. The methoxy group is co-planar with the benzene ring to which it is attached, the $\mathrm{C} 14-\mathrm{O} 1-\mathrm{C} 4-\mathrm{C} 5$ torsion angle being $-1.14(12)^{\circ}$. There is an intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond (Fig. 1 and Table 1) that generates an $S(5)$ ring motif. The bond lengths are comparable with those found for some closely related structures (Habibi et al., 2013; Aslam et al., 2012a; Kaewmanee et al., 2013, 2014; Sun et al., 2011).

## 3. Supramolecular features

In the crystal, molecules are linked via $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming zigzag chains along [101] (Fig. 2 and Table 1). The chains are linked via $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions (Fig. 3 and Table 1), forming a three-dimensional structure.

## 4. Database survey

A search of the Cambridge Structural Database (CSD, Version 5.36; Groom \& Allen, 2014) for azastilbenes gave over 2800 hits. A search for 2-(benzylideneamino) phenols gave 78 hits, and for 2-[(4-methoxybenzylidene)amino]phenols there were five hits. In the compound that most closely resembles the title compound, namely 5 -\{[(2-hydroxyphenyl)imino]-methyl\}-2-methoxyphenol (Habibi et al., 2013), the two aromatic rings are inclined to one another by ca $16.9^{\circ}$.

Table 1
Hydrogen-bond geometry ( $\AA,{ }^{\circ}$ ).
$C g 1$ and $C g 2$ are the centroids of rings C1-C6 and C8-C13, respectively.

## 5. Synthesis and crystallization

A solution of 4-methoxybenzaldehyde ( $2.5 \mathrm{mmol}, 0.37 \mathrm{~g}$ ) in water ( 20 ml ) and 2 -aminophenol ( $2.5 \mathrm{mmol}, 0.25 \mathrm{~g}$ ) in water $(20 \mathrm{ml})$ were mixed and stirred at room temperature for around 8 h until a white precipitate appeared. The resulting white solid was filtered, washed several times with cold ethanol and then dried in vacuo overnight to yield the desired azastilbene ( $430 \mathrm{mg}, 76 \%$ yield). Colourless block-shaped crystals, suitable for X-ray structure analysis, were obtained by recrystallization from methanol by slow evaporation at room temperature after several days (m.p. 388-390 K).

UV-Vis $\left(\mathrm{CH}_{3} \mathrm{OH}\right) \lambda_{\text {max }}(\log \varepsilon): 275(1.93), 340(0.61) \mathrm{nm}$; FT-IR (KBr) $v: 3337,1595,1510,1248,1027 \mathrm{~cm}^{-1} . ;{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}\right.$, DMSO- $\left.d_{6}\right) \delta$, p.p.m.: $8.87(s, 1 \mathrm{H}), 8.61(s, 1 \mathrm{H}), 7.98$ $(d, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.18(d d, J=7.5,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.06(d, J=$ $8.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.03(t d, J=7.5,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.83(t d, J=7.5$, $1.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.09(d d, J=7.5,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.84\left(s,-\mathrm{OCH}_{3}\right)$. The UV-Vis spectroscopic data showed absorption bands of an azastilbene ( 275 and 340 nm ) while the FT-IR spectrum

Computer programs: APEX2 and SAINT (Bruker, 2009), SHELXS97, SHELXL97 and SHELXTL (Sheldrick, 2008), Mercury (Macrae et al., 2008), PLATON (Spek, 2009) and publCIF (Westrip, 2010).
exhibited the stretching vibrations of $\mathrm{O}-\mathrm{H}\left(3337 \mathrm{~cm}^{-1}\right)$, $\mathrm{C}=\mathrm{N}\left(1595 \mathrm{~cm}^{-1}\right), \mathrm{C}=\mathrm{C}\left(1510 \mathrm{~cm}^{-1}\right), \mathrm{C}-\mathrm{N}\left(1248 \mathrm{~cm}^{-1}\right)$ and $\mathrm{C}-\mathrm{O} \quad\left(1027 \mathrm{~cm}^{-1}\right)$. The successful synthesis was also supported by the ${ }^{1} \mathrm{H}$ NMR spectroscopic data, which showed the characteristic signals of an olefinic proton at $8.61(s, 1 \mathrm{H})$ and para-substituted aromatic protons at $7.98(d, J=8.7 \mathrm{~Hz}$, $2 \mathrm{H})$ and $7.06(d, J=8.7 \mathrm{~Hz}, 2 \mathrm{H})$, respectively. Moreover the ${ }^{1} \mathrm{H}$ NMR spectrum also showed typical signals of ortho-substituted aromatic protons at $7.18(d d, J=7.5,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.03$ $(t d, J=7.5,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.83(t d, J=7.5,1.2 \mathrm{~Hz}, 1 \mathrm{H})$ and 6.09 $(d d, J=7.5,1.2 \mathrm{~Hz}, 1 \mathrm{H})$ and a methoxy proton at $3.84(s$, $-\mathrm{OCH}_{3}$ ).

The antibacterial activity investigation of the title compound against Gram-positive bacteria, which are $B$. subtilis, S. aureus, MRSA and E. faecalis, and Gram-negative bacteria, which are $P$. aeruginosa, S. sonnei and S. typhi, showed moderate, mild or no inhibition. The most interesting antibacterial activity showed moderate activity against $P$. aeruginosa with an MIC value of $37.5 \mu \mathrm{~g} / \mathrm{ml}$.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The OH H atom was located in a
difference Fourier map and freely refined. The C-bound H atoms were positioned geometrically and allowed to ride on their parent atoms: $\mathrm{C}-\mathrm{H}=0.93-0.96 \AA$ with $U_{\text {iso }}(\mathrm{H})=$ $1.5 U_{\mathrm{eq}}(\mathrm{C})$ for methyl H atoms and $1.2 U_{\mathrm{eq}}(\mathrm{C})$ for other H atoms.

## Special details

Experimental. The data was collected with the Oxford Cyrosystem Cobra low-temperature attachment.
Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R -factor wR and goodness of fit S are based on $\mathrm{F}^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger.
