The molecule of the title compound, $\mathrm{C}_{16} \mathrm{H}_{16} \mathrm{ClN}_{3} \mathrm{O}_{3} \mathrm{~S} \cdot \mathrm{H}_{2} \mathrm{O}$, is L-shaped being bent at the S atom; the $\mathrm{S}-\mathrm{N}-\mathrm{C}-\mathrm{C}$ torsion angle is $132.0(3)^{\circ}$. The central part of the molecule, $\mathrm{C}-\mathrm{C}-\mathrm{N}-\mathrm{N}=\mathrm{C}$, is almost linear, with the $\mathrm{C}-\mathrm{C}-\mathrm{N}-\mathrm{N}$ and $\mathrm{C}-\mathrm{N}-\mathrm{N}=\mathrm{C}$ torsion angles being -174.1 (2) and 176.0 (2) ${ }^{\circ}$, respectively. The dihedral angle between the $p$-toluenesulfonyl ring and the $\mathrm{S}-\mathrm{N}-\mathrm{C}-\mathrm{C}(=\mathrm{O})$ segment is $67.5(4)^{\circ}$, while that between the two aromatic rings is $52.17(11)^{\circ}$. In the crystal, the water H atom is involved in $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds with a sulfonamide O atom and the carbonyl O atom. The water O atom is itself hydrogen bonded to both NH hydrogen atoms. These four hydrogen bonds lead to the formation of corrugated sheets lying parallel to (100). There are also weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ contacts present within the sheets.

## 1. Chemical context

Hydrazones are an important class of organic compounds in the Schiff base family. The latter display various biological activities such as antioxidant, anti-inflammatory, anticonvulsant, analgesic, anticancer, antiparasitic, cardioprotective, antidepressant, antitubercular and anti-HIV activities. The hydrazone Schiff bases of aroyl, acyl, and heteroaroyl compounds are more versatile and flexible due to the presence of the $\mathrm{C}=\mathrm{O}$ group, an additional donor site. $N$-Acylhydrazones containing a glycine residue have been investigated extensively in recent years for their biological and medical activities (Tian et al., 2011). Acylhydrazone derivatives which contain an amino acid moiety and an electrondonating substituent in the sulfonyl phenyl ring have been demonstrated to possess good antiviral activity (Tian et al., 2009).

In view of the biological activities of these Schiff bases, which are related to structural aspects, and as part of our studies on the effects of substituents on the structures of $N$-(aryl)-amides (Gowda et al., 2000; Rodrigues et al., 2011), N -chloroarylamides (Jyothi \& Gowda, 2004) and N -bromo-aryl-sulfonamides (Usha \& Gowda, 2006), we report herein on the synthesis and crystal structure of the title compound. This acylhydrazone derivative contains an amino acid moiety and an electron-donating substituent in the $p$-toluenesulfonyl ring.

## 2. Structural commentary

The molecular structure of the title compound is illustrated in Fig. 1. The conformations of the $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}-\mathrm{H}$ bonds in the hydazone part are syn to each other, while the $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}=\mathrm{O}$ bonds in the central part and the sulfonamide $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}-\mathrm{H}$ bonds in the glycine segment are anti to each other. The $\mathrm{C} 8-\mathrm{O} 3$ bond length of 1.222 (3) $\AA$ indicates that the molecule exists in the keto form in the solid state. The C9-N3 bond length of 1.266 (3) A confirms its significant doublebond character. The N2-N3 and C8-N2 bond distances are 1.384 (3) and 1.337 (3) Å, respectively, which indicate significant delocalization of the $\pi$-electron density over the hydrazone portion of the molecule. The molecule is bent at the Satom with a $\mathrm{S} 1-\mathrm{N} 1-\mathrm{C} 7-\mathrm{C} 8$ torsion angle of $132.0(2)^{\circ}$. The other central part of the molecule is almost linear with the $\mathrm{C} 7-\mathrm{C} 8-\mathrm{N} 2-\mathrm{N} 3, \mathrm{C} 8-\mathrm{N} 2-\mathrm{N} 3-\mathrm{C} 9$ and $\mathrm{N} 2-\mathrm{N} 3-\mathrm{C} 9-\mathrm{C} 10$ torsion angles being -174.1 (2), 176.0 (2) and -176.7 (2) ${ }^{\circ}$, respectively. The orientation of the sulfonamide group with respect to the attached $p$-toluenesulfonyl ring ( $\mathrm{C} 1-\mathrm{C} 6$ ) is given by torsion angles $\mathrm{C} 2-\mathrm{C} 1-\mathrm{S} 1-\mathrm{N} 1=-99.8(2)^{\circ}$ and $\mathrm{C} 6-\mathrm{C} 1-\mathrm{S} 1-\mathrm{N} 1=76.6(2)^{\circ}$, while that of the hydrazone

$-x+1, y-\frac{1}{2},-z+\frac{1}{2} ;$ (iv) $-x+1,-y,-z$.
group with the attached benzene ring ( $\mathrm{C} 10-\mathrm{C} 15$ ) is given by torsion angles $\mathrm{C} 11-\mathrm{C} 10-\mathrm{C} 9-\mathrm{N} 3=9.9(4)^{\circ}$ and $\mathrm{C} 15-\mathrm{C} 10-$ $\mathrm{C} 9-\mathrm{N} 3=-172.1(2)^{\circ}$. The dihedral angles between the mean plane of the central segment [O3/N2/N3/C7-C9; maximum deviation $=0.065$ (3) $\AA$ for atom N 2 ] and the benzene rings (C1-C6 and C10-C15) are 65.22 (15) and $13.06(14)^{\circ}$, respectively. The two benzene rings are inclined to one another by $52.16(14)^{\circ}$.

## 3. Supramolecular features

In the crystal, the water O -atom, O 4 , shows bifurcated hydrogen bonding with the amino- H atom of the hydrazide segment (N2) and the sulfonamide-H atom (N1); see Table 1 and Fig. 2. One of the H atoms of the water molecule is hydrogen bonded with a sulfonyl O atom, O , generating $C_{2}^{2}(6)$ and $C_{2}^{2}(7)$ chains. The other H atom shows hydrogen bonding with the carbonyl O atom, O3. These four hydrogen

Figure 3
A view along the $c$ axis of the crystal packing of the title compound. Hydrogen bonds are shown as dashed lines (see Table 1 for details), and C-bound H atoms have been omitted for clarity.

bonds lead to the formation of corrugated sheets lying parallel to (100); see Table 1 and Fig. 3. There are also weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ contacts present within the sheets (Table 1).

## 4. Database survey

A search of the Cambridge Structural Database (Version 5.36; Groom \& Allen, 2014) for the fragment, viz. $-\mathrm{NH}-\mathrm{CH}_{2}-$ $\mathrm{C}(=\mathrm{O})-\mathrm{NH}-\mathrm{N}=\mathrm{CH}-$, yielded only one hit, namely $\mathrm{N}-(2-$ hydroxy-1-naphthylmethylene)- $N^{\prime}$-( $N$-phenylglycyl)hydrazine (MEMTOO; Gudasi et al., 2006).

## 5. Synthesis and crystallization

The title compound was synthesized in a number of steps. Firstly $p$-toluenesulfonyl chloride ( 0.01 mol ) was added to glycine ( 0.02 mol ) dissolved in an aqueous solution of potassium carbonate ( $0.06 \mathrm{~mol}, 50 \mathrm{ml}$ ). The reaction mixture was stirred at 373 K for 6 h , then left overnight at room temperature, filtered and then treated with dilute hydrochloric acid. The solid $N$-(4-methylbenzenesulfonyl)glycine (L1) obtained was crystallized from aqueous ethanol.

Sulfuric acid ( 0.5 ml ) was added to $\mathbf{L 1}(0.02 \mathrm{~mol})$ dissolved in ethanol ( 30 ml ) and the mixture was refluxed. The reaction was monitored by TLC at regular intervals. After completion of the reaction, the reaction mixture was concentrated to
remove excess ethanol. The product, $N$-(4-methylbenzenesulfonyl)glycine ethyl ester (L2) obtained was poured into water, neutralized with sodium bicarbonate and recrystallized from acetone.

The pure $\mathbf{L} 2(0.01 \mathrm{~mol})$ was then added in small portions to a stirred solution of $99 \%$ hydrazine hydrate ( 10 ml ) in 30 ml ethanol and the mixture was refluxed for 6 h . After cooling to room temperature, the resulting precipitate was filtered, washed with cold water and dried to obtain $N$-(4-methylbenzenesulfonyl)glycinyl hydrazide (L3).

A mixture of $\mathbf{L 3}(0.01 \mathrm{~mol})$ and 3-chlorobenzaldehyde ( 0.01 mol ) in anhydrous methanol ( 30 ml ) and two drops of glacial acetic acid was refluxed for 8 h . After cooling, the precipitate was collected by vacuum filtration, washed with cold methanol and dried. It was recrystallized to constant melting point from methanol (457-458 K). The purity of the title compound was checked and characterized by its IR spectrum. The characteristic absorptions observed are 3253.9, $1680.0,1597.1,1334.7$ and $1161.2 \mathrm{~cm}^{-1}$ for the stretching bands of $\mathrm{N}-\mathrm{H}, \mathrm{C}-\mathrm{O}, \mathrm{C}-\mathrm{N}, \mathrm{S}-\mathrm{O}$ asymmetric and $\mathrm{S}-\mathrm{O}$ symmetric, respectively.

Prism-like colourless single crystals of the title compound were grown from a DMF solution by slow evaporation of the solvent.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The water H atoms were located in a difference Fourier map and refined with the $\mathrm{O}-\mathrm{H}$ distances restrained to $0.85(2) \AA$, and with $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{O})$. The $U_{\text {eq }}$ of atoms O 1 and O 2 were restrained to approximate isotropic behaviour. The NH H atoms were also located in a difference Fourier map and refined with $\mathrm{U}_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{N})$. The C-bound H atoms were positioned with idealized geometry and refined using a riding model: $\mathrm{C}-\mathrm{H}=0.93-$ $0.97 \AA$ with $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C})$ for methyl H atoms and $1.2 U_{\mathrm{eq}}(\mathrm{C})$ for other H atoms.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
