Received 22 June 2015; accepted 23 June 2015

Edited by W. T. A. Harrison, University of Aberdeen, Scotland

The title molecule, $\mathrm{C}_{19} \mathrm{H}_{22} \mathrm{~N}_{6} \mathrm{O}_{2} \mathrm{~S}_{2}$, has crystallographically imposed $C_{2}$ symmetry, with the central C atom lying on the rotation axis. The $\mathrm{O}-\mathrm{C}-\mathrm{C}-\mathrm{C}$ torsion angle for the central chain is $-59.22(16)^{\circ}$ and the dihedral angle between the planes of the benzene rings is $75.20(7)^{\circ}$. In the crystal, $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{S}$ interactions link the molecules, forming a three-dimensional network encompassing channels running parallel to the $c$ axis, which account for about $20 \%$ of the unitcell volume. The contribution to the scattering from the highly disordered solvent molecules in these channels was removed with the SQUEEZE routine [Spek (2015). Acta Cryst. C71, 918] in PLATON. The stated crystal data for $M_{\mathrm{r}}, \mu$ etc. do not take these into account.

Keywords: crystal structure; bis-thiosemicarbazones; biological activity; SQUEEZE.

## Albayati

## S1. Comment

Currently, bis-thiosemicarbazones is considerable interest in their biological activity (Singh et al., 2001; Offiong \& Martelli, 1997) and have been known for over 50 years. Thiosemicarbazones have been reported to exhibit antivirals and as anticancer therapeutics, as well as for their parasiticidal action against Plasmodium falciparum and Trypanasoma cruzi which are the causative agents of malarya and Chagas' disease, respectively (Greenbaum et al., 2004; Finch et al., 1999; Wilson et al., 1974; Du et al., 2002). In addition, in the last few years there has been a growing attention towards thiosemicarbazones related to their range of biological properties, as antituberculosis activity (Desai et al., 1984; Shucla et al., 1984), antitumor (Vrdoljak et al., 2010), antiproliferative (Belicchi-Ferrari et al., 2010), and anticancer agents (Marzano et al., 2009). Such facts inspired us to synthesis and study the crystal structure determination of the title compound.
The title molecule has crystallographically imposed $\mathrm{C}_{2}$ symmetry (Fig. 1). The dihedral angle between the planes of the benzene rings is $75.20(7)^{\circ}$. Significant N1—H1B $\cdots 1^{1}($ i: $1.5-x,-1 / 2+y, 1 / 2-z)$ hydrogen bonds are formed in the crystal as well as weaker $\mathrm{N} 2-\mathrm{H} 2 \mathrm{~A} \cdots \mathrm{~S} 1 \mathrm{i}$ (ii: $1.5-x, 1.5-y,-z$ ) and $\mathrm{N} 1-\mathrm{H} 1 \mathrm{~A} \cdots \mathrm{~S} 1 \mathrm{iii}$ (iii: $x 1-y, 1 / 2+z$ ) interactions (Fig. 2). These lead to the formation of channels running parallel to the $c$ axis (Fig. 3).

## S2. Experimental

A mixture of $0.5 \mathrm{mmol}(142 \mathrm{mg})$ of 2,2'-[ethane-1,2-diylbis(oxy)]dibenzaldehyde and $1 \mathrm{mmol}(91 \mathrm{mg})$ of thiosemicarbazide in ethanol $(10 \mathrm{ml})$ was heated under reflux for 4 h in the presence of a catalytic amount of acetic acid. After cooling, the reaction mixture was poured into an ice-water. The resulting solid product was then filtered off, washed with water, dried and crystallized from dimethylformamide to afford the title compound. Mp 488 K .

## S3. Refinement

The H -atom (H10A) attached to C 10 was located from a difference Fourier map and refined with restraint $\mathrm{C}-\mathrm{H}=0.99$ (2) $\AA$ using a riding model, with $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{cq}}(\mathrm{C})$. The other H -atoms attached to carbon were placed in calculated positions ( $\mathrm{C}-\mathrm{H}=0.95-0.99 \AA$ ) while those attached to nitrogen were placed in locations derived from a difference map and their parameters adjusted to give $\mathrm{N}-\mathrm{H}=0.91 \AA$. All were included as riding contributions with isotropic displacement parameters 1.2 times those of the attached atoms. A region of density amounting to the scattering from approximately 1.5 carbon atoms, apparently disordered about the twofold axis and well removed from the main molecule was removed with PLATON SQUEEZE (Spek, 2009) after it proved impossible to identify it with any reasonable solvent or byproduct molecule.

Figure 1
The title molecule with labeling scheme and $50 \%$ probability ellipsoids. Atoms with the suffix a are related to their counterparts by the crystallographic twofold axis passing through C10.

Figure 2
Packing viewed down the $b$ axis. $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{S}$ hydrogen bonds are shown, respectively, as blue and purple dotted lines.

Figure 3
Packing viewed down the the $c$ axis showing the one-dimensonal channels.

$(\Delta / \sigma)_{\text {max }}=0.001$
$\Delta \rho_{\text {max }}=0.24 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\text {min }}=-0.22 \mathrm{e}^{-3}$

## Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles
Refinement. Refinement on $F^{2}$ for ALL reflections except those flagged by the user for potential systematic errors. Weighted $R$-factors $w R$ and all goodnesses of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The observed criterion of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating - $R$-factor-obs etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$-factors based on ALL data will be even larger.
