# Crystal structure of $\mathrm{N}, \mathrm{N}$-dimethyl-2-[(4-methylbenzyl)sulfonyl]ethanamine 

Alan R. Kennedy, Abedawn I. Khalaf, Fraser J. Scott* and Colin J. Suckling

Westchem, Department of Pure \& Applied Chemistry, University of Strathclyde, 295 Cathedral Street, Glasgow G1 1XL, Scotland. *Correspondence e-mail: fraser.j.scott@strath.ac.uk

In the crystal, the title compound, $\mathrm{C}_{12} \mathrm{H}_{19} \mathrm{NO}_{2} \mathrm{~S}$, has a disordered structure with two equally populated conformations of the amine fragment. A pair of weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ intermolecular interactions between the $\mathrm{CH}_{2}$ and $\mathrm{SO}_{2}$ groups gives a one-dimensional supramolecular structure that propagates through translation along the $a$-axis direction.

## 1. Chemical context

Parasitic helminths possess a number of evolutionary strategies that facilitate their co-existence with their host and, as such, up to one third of the global population may suffer from helminthetic infections (de Silva et al., 2003). These parasites can secrete immunomodulatory molecules that prevent the parasites' clearance from the host without leaving the host vulnerable to opportunistic infections (Hewitson et al., 2009). ES-62 is one such immunomodulatory molecule, a protein, which was discovered in the secretions of the rodent filarial nematode Acanthocheilonema and demonstrated to induce an anti-inflammatory immunological phenotype (Harnett et al., 1989). ES-62 has been studied for its potential to treat human diseases relating to inflammation, for example collageninduced arthritis or rheumatoid arthritis, and many positive outcomes have been demonstrated.

A number of the significant anti-inflammatory activities of ES-62 are associated with post-translational glycosylation and subsequent esterification by phosphorylcholine. However, ES62 is an immunogenic protein and is thus unsuitable as a drug itself (Harnett \& Harnett, 2009). We have sought to capitalize on the immunomodulatory effects of ES-62 whilst avoiding its inherent undrugability through synthesizing a library of druglike small molecules based upon phosphorylcholine, the active moiety of ES-62. A series of sulfone analogues (Fig. 1) have proven to be of great significance in our investigations into

Figure 1
General structure of sulfone analogues. $R$ represents alkyl chains and $X$ represents halogen substituents.
collagen-induced arthritis. Despite the apparent simplicity of these molecules, we are aware of no relevant crystallographic study. As such, and as the title compound is of particular interest to our ongoing work (Al-Riyami et al., 2013), we report herein on the solid-state structure of the title compound.

## 2. Structural commentary

The molecular structure of the title compound is shown in Fig. 2. The amine group is disordered over two equally occupied sites such that the lone pair of the pyramidal N atom is anti to O 1 with respect to the plane defined by $\mathrm{C} 1-\mathrm{S} 1-\mathrm{C} 9$ for the conformer containing N 1 but syn for the $\mathrm{N} 1 A$ conformer.

## 3. Supramolecular features

Neighbouring molecules related by translation along the $a$ axis direction are connected by two weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds involving O 1 and C 1 and $\mathrm{C} 9 / \mathrm{C} 9 A$ (Table 1 and Fig. 3). This gives one-dimensional supramolecular chains of mol-

Figure 2
The molecular structure of the title compound with non-H atoms shown as $50 \%$ probability displacement ellipsoids. For the disordered fragment, the atoms labelled with the suffix 'a' have been shown with hollow bonds whilst all other bonds are shown as solid lines.

Table 1
Hydrogen-bond geometry ( $\AA^{\circ}{ }^{\circ}$ ).

| $D-\mathrm{H} \cdots A$ | $D-\mathrm{H}$ | $\mathrm{H} \cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{C} 1-\mathrm{H} 1 A \cdots$ O1 $^{\mathrm{i}}$ | 0.99 | 2.60 | $3.493(2)$ | 150 |
| C9-H9A $^{\mathrm{i}}$ | 0.99 | 2.49 | $3.415(2)$ | 155 |
| C9 $^{\mathrm{H}}-\mathrm{H} 9 C \cdots$ O1 $^{\mathrm{i}}$ | 0.99 | 2.61 | $3.415(2)$ | 138 |

Symmetry code: (i) $x-1, y, z$.
ecules that propagate parallel to the crystallographic $a$-axis direction.

Other close interactions involve the disordered fragment. Thus the methyl group of $\mathrm{C} 11 A$ approaches the aromatic ring, giving a $\mathrm{C}-\dot{\mathrm{c}} \pi$ interaction [closest contact $\mathrm{C} 6 \cdots \mathrm{C} 11 A=$ 3.345 (5) A] whilst C11 forms unfeasibly short intermolecular interactions with its centrosymmetrically related self - an interaction that is relieved by the observed disorder.

## 4. Synthesis and crystallization

A mixture of 2-[(4-methylbenzyl)sulfonyl]ethyl methanesulfonate and 1-methyl-4-[(vinylsulfonyl)methyl]benzene $(4.880 \mathrm{~g})$ was dissolved in dichloromethane ( 50 ml , dry) to which dimethylamine ( $4 \mathrm{ml}, 2 M$ in THF) was added at room temperature with stirring. The stirring was continued at room temperature overnight. The reaction mixture was extracted with a saturated solution of sodium carbonate. The organic layer was collected, dried over $\mathrm{MgSO}_{4}$, filtered and the solvents were removed under reduced pressure and the crude product was applied to a silica gel column chromatography using first ethyl acetate $/ n$-hexane $(1 / 1, \mathrm{RF}=0.1)$ and then ethyl acetate/methanol (9/1). The product was obtained as a white solid which was recrystallized from ethyl acetate $/ n$ hexane ( 2.200 g ) (m.p. 341-343 K). HRESIMS: calculated for $\mathrm{C}_{12} \mathrm{H}_{19} \mathrm{NO}_{2} \mathrm{~S}, 241.1136$; found: 241.1139.

Figure 3
Part of the molecular chain formed by translation along $a$ highlighting the $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ contacts. Only one of the two disordered conformations is shown.

## 5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. Models where the site occupancy factors of the disordered groups were allowed to refine gave occupancies equal to $50 \%$. So in the final model, occupancies of all the disordered atoms were set to this value. The C9C 10 and $\mathrm{C} 9 A-\mathrm{C} 10 A$ distances were restrained to be 1.53 (1) Å. All H atoms were placed in idealized positions and were refined in riding modes with $\mathrm{C}-\mathrm{H}$ equal to $0.95,0.98$ and $0.99 \AA$ for $\mathrm{CH}, \mathrm{CH}_{2}$ and $\mathrm{CH}_{3}$ groups, respectively, and $U_{\text {iso }}(\mathrm{H})$ $=1.5 U_{\mathrm{eq}}(\mathrm{C})$ for methyl groups and $1.2 U_{\mathrm{eq}}(\mathrm{C})$ for all other groups.

## Special details

Experimental. ${ }^{1} \mathrm{H}$ NMR (DMSO-d ${ }_{6}$ ): $\delta 7.28(2 H, \mathrm{~d}, \mathrm{~J}=8.0 \mathrm{~Hz}), 7.21(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.0 \mathrm{~Hz}), 4.44(2 \mathrm{H}, \mathrm{s}), 3.17(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=$ $14.3 \mathrm{~Hz}), 2.65(2 H, \mathrm{t}, \mathrm{J}=14.3 \mathrm{~Hz}), 2.31(3 H, \mathrm{~s}), 2.16(6 H, \mathrm{~s}) .{ }^{13} \mathrm{C}$ NMR (DMSO-d $\left.\mathrm{d}_{6}\right): \delta 137.7,130.8,129.0,125.4,58.4$, 51.6, 49.0, 44.9, 20.7. IR (KBr): 1511, 1463, 1399, 1380, 1314, 1258, 1156, 1119, 1050, 892, 853, 822, $749 \mathrm{~cm}^{-1}$.

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
