In the title compound, $\mathrm{C}_{13} \mathrm{H}_{10} \mathrm{BrN}_{3} \mathrm{O}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$, the conformation about the azomethine double bond is $E$. The molecule exists in the amido form with a $\mathrm{C}=\mathrm{O}$ bond length of $1.229(2) \AA$. There is an intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond forming an $S(6)$ ring motif. The whole molecule is almost planar, with an r.m.s. deviation of $0.021 \AA$ for all non-H atoms, and the dihedral angle between the planes of the pyridine and benzene rings is $0.74(12)^{\circ}$. In the crystal, the water molecule of crystallization links the organic molecules via Ow$\mathrm{H} \cdots \mathrm{O}, \mathrm{Ow}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{Ow}$ hydrogen bonds and short $\mathrm{C}-\mathrm{H} \cdots \mathrm{Ow}$ contacts, forming sheets lying parallel to (100). Within the sheets there is a weak $\pi-\pi$ interaction involving the pyridine and benzene rings [centroid-to-centroid distance $=3.8473(15) \AA]$. The sheets are linked via $\mathrm{C}-\mathrm{H} \cdots \mathrm{Br}$ interactions, forming a three-dimensional network.

## 1. Chemical context

Aroylhydrazones can coordinate to transition metals either in the amido form (Bessy Raj \& Kurup, 2007) or in the iminolato form (Ghosh et al., 2005; Galić et al., 2011), leading to the formation of two types of complexes. Hydrazones derived from isonicotinoyl hydrazides are potential drugs for the treatment of the iron-overload associated diseases (Macková et al., 2012). They are associated with a broad spectrum of biological activities, and studies have shown that nicotinic acid hydrazones could be considered as anti-inflammatory and analgesic agents (Navidpour et al., 2014; Kheradmand et al., 2013) and as a novel pharmacophore in the design of anticonvulsant drugs (Sinha et al., 2011). Hydrazones have been used in chemical processes, in non-linear optics and as sensors as well as in catalytic processes (Hosseini-Monfared et al., 2013; Du \& Hong, 2014). Their potential as analytical reagents (Galić et al., 2011) and their uses as molecular switches, metallo-assemblies and sensors have also been reported (Su \& Aprahamian, 2014). Salicylaldehyde isonicotinoylhydrazone has also been used for the spectrophotometric determination of gallium(III) and indium(III) (Reddy et al., 2011).

Figure 1
A view of the molecular structure of the title compound, showing the atom labelling. Displacement ellipsoids are drawn at the $50 \%$ probability level.

## 2. Structural commentary

The title compound, Fig. 1, exists in the amido form with a $\mathrm{C} 8=\mathrm{O} 2$ bond length of 1.229 (2) Å. The molecule has an $E$ conformation with respect to the azomethine bond, which is confirmed by the torsion angle $\mathrm{C} 6-\mathrm{C} 7=\mathrm{N} 1-\mathrm{N} 2$ of 179.09 (19) ${ }^{\circ}$. The two aromatic rings ( $\mathrm{C} 1-\mathrm{C} 6$ and $\mathrm{N} 3 / \mathrm{C} 9-\mathrm{C} 13$ ), are inclined to the almost planar hydrazone moiety $[\mathrm{O} 2 / \mathrm{C} 8 /$ $\mathrm{N} 2 / \mathrm{N} 1 / \mathrm{C} 7$; planar to within $0.006(2) \AA$ ] by 2.12 (9) and $1.40(8)^{\circ}$, respectively, and to each other by $0.74(12)^{\circ}$. There is an intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond present in the molecule that involves the phenolic oxygen, O1 and the azomethine nitrogen atom, N 1 , forming an $S(6)$ ring motif (Table 1 and Fig. 1).

## 3. Supramolecular features

In the crystal, the water molecule forms three hydrogen bonds with three different nicotinic hydrazone molecules (Table 1 and Fig. 2). This compound is an example of a system where a single atom acts both as donor and acceptor. There are also $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ (water) contacts present enclosing $R_{2}^{1}(6)$ and $R_{2}^{1}(7)$ ring motifs (Fig. 2). Finally sheets are formed lying parallel to (100). There are weak $\pi-\pi$ interactions within the sheets involving the bromine-bearing aromatic ring of one molecule and the pyridine ring of another, with a centroid-centroid

Figure 2
Hydrogen bonds (dashed lines) and a weak $\pi-\pi$ interaction (in blue) in the crystal of the title compound [symmetry codes: (i) $x,-y+\frac{1}{2}, z+\frac{1}{2}$; (ii) $\left.-x, y+\frac{1}{2},-z+\frac{1}{2}\right]$.

Symmetry codes: (i) $x,-y+\frac{1}{2}, z+\frac{1}{2}$; (ii) $-x, y-\frac{1}{2},-z+\frac{1}{2}$; (iii) $x-1, y, z-1$.
distance of 3.8473 (15) $\AA$ (Fig. 2). The sheets are linked via $\mathrm{C}-\mathrm{H} \cdots \mathrm{Br}$ interactions, forming a three-dimensional network (Table 1 and Fig. 3).

## 4. Database survey

A search of the Cambridge Structural Database (Version 5.36, update Feb. 2015; Groom \& Allen, 2014) yielded 22 hits for the substructure $N^{\prime}$-(2-hydroxybenzylidene)nicotinohydrazide. The crystal structure of $N^{\prime}$-(2-hydroxybenzylidene)nicotinohydrazide itself is reported as a monohydrate (IDASUB; Galić et al., 2001), and the crystal structure of the chloro derivative of the title compound, which crystallized with two independent molecules in the asymmetric unit, has also been reported (MOZPIB; Ren, 2009). In these two

Figure 3
A view along the $c$ axis of the crystal packing of the title compound. Hydrogen bonds are shown as dashed lines (see Table 1 for details) and H atoms not involved in hydrogen bonding have been omitted for clarity.

Table 2
Experimental details.

Computer programs: APEX2, SAINT and XPREP (Bruker, 2004), SHELXS2014 (Sheldrick, 2008), SHELXL2014 (Sheldrick, 2015), ORTEP-3 for Windows (Farrugia, 2012), DIAMOND (Brandenburg, 2010), Mercury (Macrae et al., 2008), PLATON (Spek, 2009) and publCIF (Westrip, 2010).
compounds, an intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond is also present. The molecules are also relatively planar, with the benzene and pyridine rings being inclined to one another by $c a$ $4.2^{\circ}$ in IDASUB, and by ca 12.8 and $1.9^{\circ}$ in the two independent molecules of MOZPIB. This last dihedral angle is similar to that in the title compound [cf. $\left.0.74(12)^{\circ}\right]$. In the crystal structure of $N^{\prime}$-(2-hydroxybenzylidene)nicotinohydrazide monohydrate (IDASUB), the water molecule forms three hydrogen bonds and is another example of a system where a single atom acts both as donor and acceptor.

## 5. Synthesis and crystallization

The title compound was prepared by adapting a reported procedure (Mathew \& Kurup, 2011). A methanolic solution of 5-bromosalicylaldehyde ( $0.10051 \mathrm{~g}, 0.5 \mathrm{mmol}$ ) and nicotinic hydrazide ( $0.06857 \mathrm{~g}, 0.5 \mathrm{mmol}$ ) was refluxed for 3 h with two drops of glacial acetic acid. Light-yellow block-shaped crystals of the title compound were obtained by slow evaporation of the solvent. The crystals were filtered, washed with minimum quantity of methanol and dried over $\mathrm{P}_{4} \mathrm{O}_{10}$ in vacuo (yield: $0.22 \mathrm{~g}, 68.5 \%$; m.p.: 480 K ). Elemental analysis calculated for $\mathrm{C}_{13} \mathrm{H}_{10} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{Br} \cdot \mathrm{H}_{2} \mathrm{O}: \mathrm{C}, 46.17, \mathrm{H}, 3.58$, $\mathrm{N}, 12.43 \%$; found: C, $46.14, \mathrm{H}, 3.57$, N, 12.44\%. IR FT-IR ( $\mathrm{KBr}, \mathrm{cm}^{-1}$ ) 3059 (NH), $3269(\mathrm{OH}), 1680(\mathrm{C}=\mathrm{O}), 1584(\mathrm{C}=\mathrm{N})$.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The water, hydroxyl and NH H atoms were located in difference Fourier maps and refined with distances restraints: $\mathrm{O}-\mathrm{H}=0.86$ (1) $\AA$ and $\mathrm{N}-\mathrm{H}=$ 0.88 (1) $\AA$. All C-bound H atoms were placed in calculated positions and refined as riding: $\mathrm{C}-\mathrm{H}=0.93 \AA$ with $U_{\text {iso }}(\mathrm{H})=$ $1.2 U_{\text {eq }}(\mathrm{C})$. Three reflections were omitted owing to bad agreement, viz. 100, 110 and 200.

## Acknowledgements

NA is grateful to the UGC, New Delhi, India, for the award of a Senior Research Fellowship. MRPK is grateful to the UGC, New Delhi, India, for a UGC-BSR one-time grant to Faculty. We also thank the Sophisticated Analytical Instruments Facility, Cochin University of S\&T, Kochi-22, India, for the diffraction measurements.

## Special details

Geometry. All esds (except the esd in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
