Received 9 July 2015; accepted 14 July 2015

Edited by D.-J. Xu, Zhejiang University (Yuquan Campus), China

The title compound, $\mathrm{C}_{9} \mathrm{H}_{10} \mathrm{O}_{3}$, is a bioactive secondary metabolite, isolated from the endophytic fungus Nodulisporium sp. The compound exhibits an intramolecular $\mathrm{O}-$ $\mathrm{H} \cdots \mathrm{O}$ hydrogen bond between the phenolic H atom and the carbonyl O atom of the adjacent acetyl group. In the crystal, molecules are linked by hydrogen bonds involving the 4phenolic H atom and a symmetry-related carbonyl O atom of a neighboring molecule, resulting in extended supramolecular chains along the $a$-axis direction. Aromatic $\pi-\pi$ stacking interactions between the nearly parallel benzene rings of adjacent chains [centroid-centroid distance $=3.7478$ (8) Å] further stabilize the three-dimensional supramolecular framework.

Keywords: crystal structure; 1-(2,4-dihydroxy-6-methylphenyl)ethanone; bioactive secondary metabolite; hydrogen bonding; $\pi-\pi$ stacking.

## Crystal structure of 1-(2,4-dihydroxy-6-methylphenyl)ethanone

## Samran Prabpai and Palangpon Kongsaeree

## S1. Comment

The title compound $\mathrm{C}_{9} \mathrm{H}_{10} \mathrm{O}_{3}$ (Fig. 1), 2,4-dihydroxy-6-methylacetophenone [systematic name: 1-(2,4-dihydroxy-6methylphenyl) ethanone], was a pentaketide secondary metabolite isolated from the culture media of the endophytic fungus Nodulisporium sp. Derivatives of this acetophenone have been demonstrated to possess interesting pharmacological activities, such as inhibition of lettuce seeds (Tabuchi et al., 2014), bacterial plasmid transfer inhibition (Das and Khosla, 2009) and anticancer activity (Suzuki et al., 2006). It is an important biosynthesis precursor for a large varieties of bioactive polyketides.
The geometric parameters of this compound (Fig. 2) are comparable with previously reported values of similar acetophenone compounds (Azeezaa et al., 2009; Chakkaravarthi et al., 2007a; Hill et al., 2012). The bond lengths of C7-C8 and C6-C12 (1.4970 (2) and $1.5050(2) \AA)$, longer than that of C1—C7 (1.4580 (2) $\AA$ ), may be a result of a resonant effect between $\mathrm{C} 7-\mathrm{O} 9(1.2485(18) \AA)$ carbonyl group and the aromatic ring. The bond length of C2-O10 (1.3466 (18) $\AA$ ) is shorter than $\mathrm{C} 4-\mathrm{O} 11(1.3573(19) \AA)$. This may be a result of O10 being involved in an intramolecular hydrogen bond. The acetyl group is coplanar with the aromatic ring $\mathrm{C} 2-\mathrm{C} 1-\mathrm{C} 7-\mathrm{O} 9$ (dihedral angle of $7.2(2)^{\circ}$ ). The torsion angles C7-C1-C6-C12 and C7-C1-C6-C5 [1.9 (2) ${ }^{\circ}$ and $-179.75(13)^{\circ}$, respectively] indicate a planar conformation of the respective moieties. An intramolecular hydrogen bond was observed between the 2-phenolic hydrogen to the carbonyl group, $\mathrm{O} 10-\mathrm{H} 10 \cdots \mathrm{O} 9\left(\mathrm{D}-\mathrm{H} \cdots \mathrm{A}=2.4983(16) \AA\right.$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}=145^{\circ}$ ) to hold a carbonyl functionality in the coplanar plane of the aromatic ring. Intermolecular hydrogen bonds between the 4-hydroxyl group to the carbonyl oxygen $\mathrm{O} 11-\mathrm{H} 11 \cdots \mathrm{O} 9\left(\mathrm{D}-\mathrm{H} \cdots \mathrm{A}=2.7862(18) \AA\right.$ and $\left.\mathrm{O}-\mathrm{H} \cdots \mathrm{O}=171^{\circ}\right)$ link the molecules in to an extended polymeric structure (Fig. 1). The $\pi \cdots \pi$ stacking intermolecular interactions between two aromatic rings (centriod C1—C6) with a distance of (3.7478 (8) Å) (Fig. 2), further stabilize the three-dimensional network.

## S2. Experimental

The culture media of the endophytic fungus Nodolisporium sp . ( 10 L ) were extracted with EtOAc ( $6 \times 500 \mathrm{~mL}$ ). After removal of the solvent under reduced pressure, the EtOAc extract ( 2.25 g ) was subjected to column chromatography over silica gel eluting with EtOAc:hexane (30-100\%), followed by MeOH:EtOAc ( $0-100 \%$ ) to yield fractions 1-19. After combination and removal of the solvents, fraction $4(162.9 \mathrm{mg})$ was further purified by Sephadex LH-20 $\left(20 \% \mathrm{H}_{2} \mathrm{O}-\right.$ MeOH ) to yield 2,4-dihydroxy-6-methylacetophenone ( 133 mg ). Single crystals were obtained by slow evaporation from EtOAc solution.

## S3. Refinement

The methyl H atoms were constrained to an ideal geometry with $\mathrm{C}-\mathrm{H}$ distances of $0.98 \AA$ and each group was allowed to rotate freely about its $\mathrm{C}-\mathrm{C}$ bond. All other hydrogen atoms were placed in idealized locations ( $\mathrm{C}-\mathrm{H}=0.96-0.98 \AA$, $\mathrm{O}-\mathrm{H}=0.82 \AA$ ) and refined as riding with $\mathrm{U}_{\text {iso }}(\mathrm{H})=1.2 \mathrm{U}_{\mathrm{eq}}(\mathrm{C})$ or $1.5 \mathrm{U}_{\mathrm{eq}}(\mathrm{O}$, methyl C).

Figure 1
The molecular structure of the title compound with displacement ellipsoids drawn at the $50 \%$ probability level.

Figure 2
The partial packing diagram shows layers of molecules built up by bifurcated $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds and $\pi-\pi$ intermolecular interactions between phenyl rings.

Extinction coefficient: 0.06 (2)

## Special details

Geometry. All e.s.d.'s(except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of F2 against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on F2, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative F 2 . The threshold expression of $\mathrm{F} 2>\sigma(\mathrm{F} 2)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on F2 are statistically about twice as large as those based on $F$, and $R$-factors based on ALL data will be even larger.
