Received 16 July 2015; accepted 3 August 2015

Edited by R. F. Baggio, Comisión Nacional de Energía Atómica, Argentina

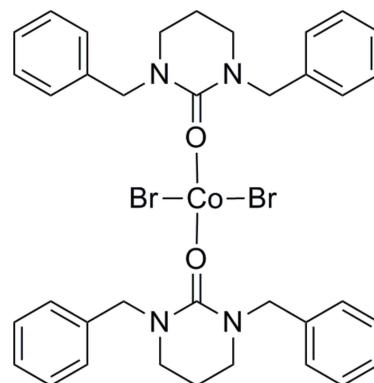

The unit cell of the title complex,  $[\text{CoBr}_2(\text{C}_{18}\text{H}_{20}\text{N}_2\text{O})_2]$ , contains 1.5 formula units per asymmetric unit with one molecule sitting on a general site and a second one halved by a crystallographic twofold rotation axis passing through the  $\text{Co}^{II}$  cation. Both  $\text{Co}^{II}$  atoms are coordinated in a distorted tetrahedral manner by two  $\text{Br}^-$  ligands and two O atoms of the pyrimidinone (OPyr) groups. The  $\text{Br}-\text{Co}-\text{Br}$  coordination angles are similar [115.46 (4) and 115.20 (5) $^\circ$ ], while the  $\text{O}-\text{Co}-\text{O}$  angles differ slightly more [102.26 (18) and 98.1 (2) $^\circ$ ]. Similarly, the  $\text{Co}-\text{Br}$  bond lengths are almost identical [2.3721 (9), 2.3757 (10) and 2.3809 (10) Å], with a larger difference between the  $\text{Co}-\text{O}$  bond lengths [1.929 (4), 1.926 (4) and 1.955 (4) Å]. The three independent OPyr groups present envelope conformations, with three C and two N atoms lying in well defined planes with maximum deviations from the least-squares planes of 0.047, 0.031 and 0.036 Å, and the external-most C atoms protruding by 0.654 (6), 0.643 (7) and 0.656 (6) Å out of the planes. The dihedral angles between the planar fractions of the OPyr planes are 50.5 (1) $^\circ$  for the nonsymmetric molecule and 49.7 (1) $^\circ$  for the symmetric one. Non-covalent interactions are of the  $\text{C}-\text{H}\cdots\text{Br}$  type and they are weak, hardly shorter than van der Waals radii, with an  $\text{H}\cdots\text{Br}$  distance range of 3.00–3.04 Å. The intermolecular interactions define chains parallel to [101].

**Keywords:** crystal structure; coordination compound; cobalt pyrimidinone complex;  $\text{C}-\text{H}\cdots\text{Br}$  interactions.

**CCDC reference:** 1416578

## Crystal structure of dibromidobis(1,3-dibenzyl-1,3-diazinan-2-one- $\kappa$ O)cobalt(II)

Eduard Rais, Ulrich Flörke and René Wilhelm

### S1. Synthesis and crystallization

Cobalt powder (0.222 g, 3.772 mmol, 20 eq, grain size < 150  $\mu$ m) and 1,3-dibenzyl-2-bromo-3,4,5,6-tetrahydro-pyrimidin-1-i um bromide (0.080 g, 0.187 mmol, 1 eq) were filled into a schlenk tube equipped with a stirring bar. Dimethylformamide (3 mL) was added and the mixture was stirred and heated at 120 °C for 16 h under inert gas. The cooled down mixture was filtrated and the solvent was removed under vacuum. The residue was mixed with toluene until there was a light blue solution which was filtrated and overlayed carefully with pentane. Blue needle-shaped crystals suitable for X-ray diffraction were obtained after three days.

HR-ESI-MS [ $C_{36}H_{40}BrCoN_4O_2$ ]<sup>+</sup> [m/z]; calc.: 698.1667; found: 698.1673. IR(KBr)  $\nu$  [cm<sup>-1</sup>] = 3437, 2924, 2387, 2285, 1595, 1548, 1454, 1436, 700.

### S2. Refinement

Crystalline material was of very poor quality, so various attempts were made to collect a reasonably sufficient data set. The final one still suffered from problems to give high  $R_{\text{int}}$ , low ratio observed/unique reflections and a ratio data/parameters of only 8, but led to suitable refinement results.

Hydrogen atom positions were derived from geometrical considerations and then refined at idealized positions riding on the carbon atoms with isotropic displacement parameters  $U_{\text{iso}}(\text{H}) = 1.2U(\text{Ceq})$  and C–H 0.95–0.99 Å.

### S3. Structural commentary

Although the present data set is only of mean quality (see Refinement Section), this very rare example of a  $MX_2(\text{OPyr})_2$  structure ( $M$  = transition metal;  $X$  = halogen; OPyr = pyrimidinone ligand) can be characterized adequately. Both Co centres are coordinated in a distorted tetrahedral manner from each two Br ligands and two oxygen atoms of the pyrimidinone (OPyr) groups. The enclosed angles are Br–Co1–Br 115.46 (4) $^\circ$ , O–Co1–O 102.26 (19) $^\circ$ , Br–Co2–Br 115.20 (5) $^\circ$  and O–Co2–O 98.1 (2) $^\circ$ , as well. Co–Br bond lengths range from 2.3722 (9) to 2.3809 (10) Å, Co–O bond lengths from 1.926 (4) to 1.955 (4) Å, resp. The O–C bonds are equal with 1.253 (6) to 1.284 (6) Å and the Co–O–C angles differ strongly with 141.1 (4) $^\circ$  at O1 and 166.8 (4) $^\circ$  at O2 of molecule 1 and 152.7 (4) $^\circ$  at O3 of molecule 2. To date, only two other  $MX_2(\text{OPyr})_2$  structures are known: the *N,N'*-dimethyl nickel analogue (Bobicz *et al.*, 2002) and the *N,N'*-dimethyl diiodo cadmium compound (Lundberg & Eriksson, 2006). Both show similar  $X$ –M–X angles of about 126 $^\circ$ , but very different O–M–O angles of 105.83 (12) $^\circ$  (Ni) and 94.78 (16) $^\circ$  (Cd). Additionally, these structures show almost perpendicular orientation of their respective OPyr planes, but for the two title compounds the resulting dihedral angles are 50.5 (1) $^\circ$  for molecule 1 and 49.7 (1) $^\circ$  for molecule 2. C3, C7 and C53 atoms have not been considered.

The shortest intramolecular hydrogen bond interaction is C20—H20A…Br2 with H…Br 2.966 Å. Intermolecular interactions tightly shorter than van der Waals radii are C8–H8B…Br1(-x + 0.5, -y + 2.5, -z), C70–H70B…Br3(-x, y, -z + 0.5) and C54–H54A…Br2(x, y - 1, z), see Table. These link molecules into endless rows approximately elongated along [101],

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
