Edited by W. T. A. Harrison, University of Aberdeen, Scotland

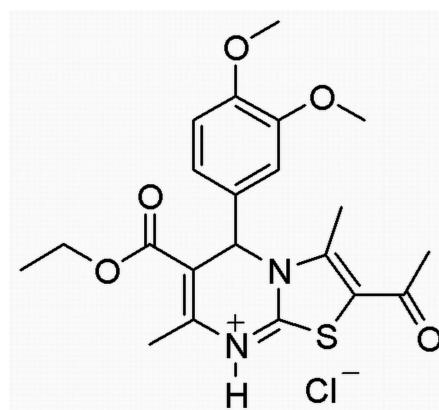

The title molecular salt, $C_{21}H_{25}N_2O_5S^+\cdot Cl^-$, crystallizes with two ion pairs in the asymmetric unit. The cations have similar conformations (r.m.s. overlay fit = 0.40 Å), with one of them showing disorder of the terminal methyl group of the ester in a 0.72 (2):0.28 (2) ratio. In the first cation, the 3,4-dimethoxy-substituted phenyl ring subtends a dihedral angle of 88.38 (7)° with the pyrimidine ring and 6.79 (8)° with the thiazole ring. The equivalent data for the second cation are 89.97 (3) and 6.42 (7)°, respectively. The pyrimidine ring adopts a sofa conformation in each cation. In the crystal, the components are linked by N—H···Cl hydrogen bonds, generating isolated ion pairs. The ion pairs are linked by C—H···O interactions, generating a three-dimensional network. In addition, a weak C—H···π interaction is observed.

Keywords: crystal structure; salt; pyrimidinium; chloride; pyrimidine derivatives; pharmacological properties; biological activity; hydrogen bonding; C—H···π interactions.

Crystal structure of 2-acetyl-5-(3,4-dimethoxyphenyl)-6-ethoxycarbonyl-3,7-dimethyl-5*H*-thiazolo[3,2-*a*]pyrimidin-8-ium chloride

N. L. Prasad, M. S. Krishnamurthy and Noor Shahina Begum

S1. Comment

Pyrimidine derivatives are of interest because of their useful biological and therapeutic activities (Ashok *et al.*, 2007). The presence of both pyrimidine and thiazole rings results in enhanced activity (Alam *et al.*, 2010; Kulakov *et al.*, 2009). Thiazolo [3,2-*a*]pyrimidine derivatives generate enzyme inhibitors as novel therapeutical entities for severe neurodegenerative diseases (Zhi *et al.*, 2008). In continuation to our research interests on thiazolo[3,2-*a*]pyrimidine derivatives (Prasad *et al.*, 2014; Nagarajaiah *et al.*, 2012), we report the crystal structure of the title compound. During the synthesis of one of the thiazolopyrimidine derivatives, an intermediate $[C_{21}H_{25}N_2O_5S]^{+} Cl^{-}$ (I) was isolated and the structure was confirmed by X-ray diffraction.

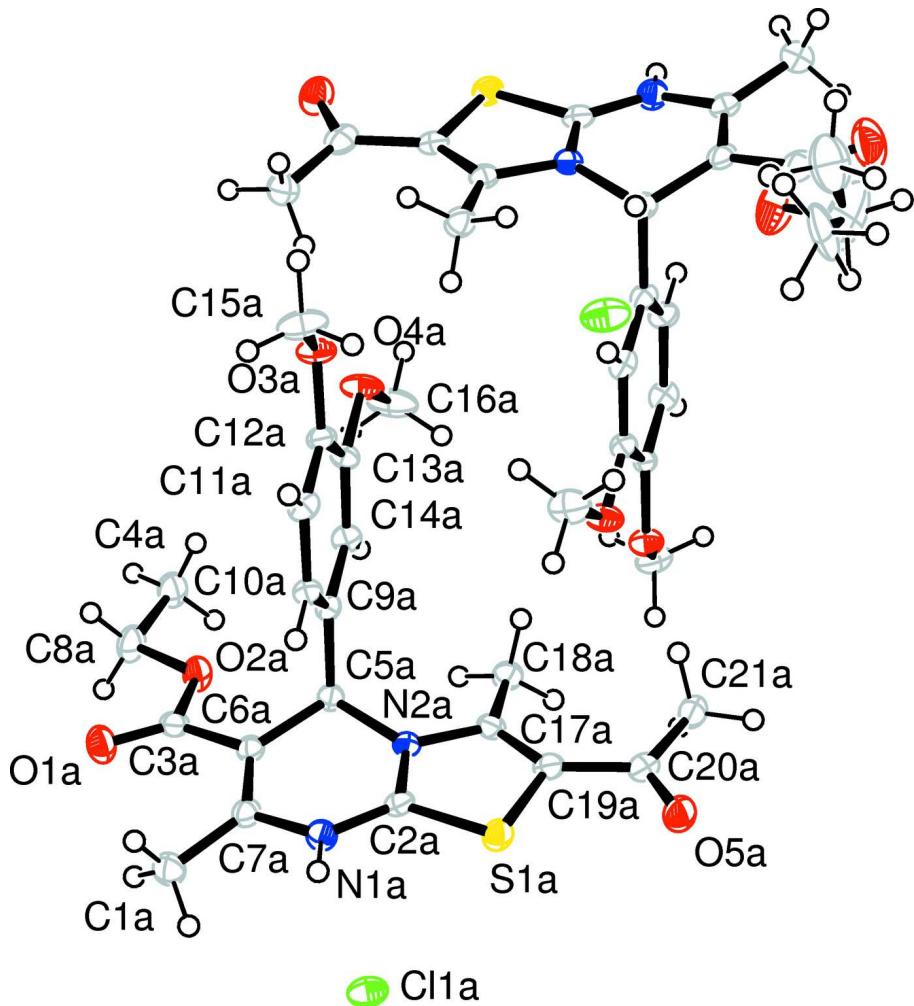

The molecular structure of the compound is shown in Fig. 1. The title compound, $[C_{21}H_{25}N_2O_5S]^{+} Cl^{-}$, crystallizes in the triclinic space group with two molecules in the asymmetric unit. In molecules A and B, the 3,4-dimethoxy substituted phenyl ring form dihedral angle of 88.38 (7) $^{\circ}$ / 89.97 (3) $^{\circ}$ with mean plane of the pyrimidine ring and 6.79 (8) $^{\circ}$ / 6.42 (7) $^{\circ}$ with thiazole ring respectively. The two values separated by / corresponds to the two molecules in the asymmetric unit. The pyrimidine ring adopts a *sofa* conformation with atom C5A displaced by -0.2637 (3) Å from the mean plane of the other five atoms (N1A/C2A/N2A/C6A/C7A). The carbonyl group of the exocyclic ester at C6A and C6B adopts a *cis* orientation with respect to C6A=C7A and C6B=C6B double bond and the 3,4-dimethoxy substituted phenyl ring shows an *syn* periplanar conformation with respect to C5A—H5A and C5B—H5B bond of the pyrimidine ring. Phenyl ring at C5A and C5B in both the molecules shows antagonist (aryl-group up) conformation (Rovnyak *et al.*, 1995). The packing features C—H···O interactions. The weak C11A—H11A···O5B hydrogen bonds forms supramolecular assembly along the crystallographic [101], which are in turn linked by another two C—H···O interactions (C15B—H15C···O5A & C21A—H21D···O3B) resulting in a ring with the graph set $R^2_2(7)$ notation (Table. 1; Fig. 2). The crystal packing also features N1A—H1A···Cl1A & N1B—H1B···Cl1B interactions. In addition, a weak C—H···π interaction of the type C4A—H4A2···Cg (*Cg* being the centroid of the phenyl ring) at a distance of 2.628 Å is also observed (Fig. 3).

S2. Experimental

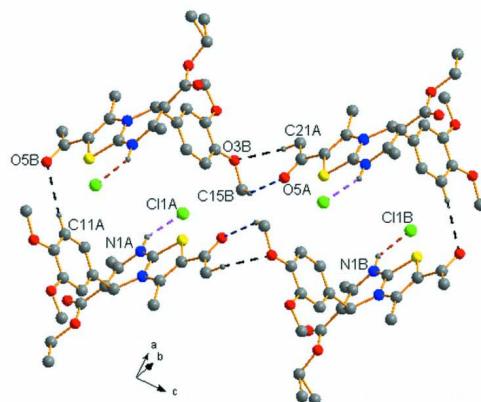

A mixture of 4-(3,4-dimethoxy-phenyl)-6-methyl-2-thioxo-1,2,3,4-tetrahydro-pyrimidine-5-carboxylic acid ethyl ester (10 mmol) and 3-chloro-2,4-pentanedione (10 mmol) was refluxed in dry ethanol (20 mmol) for 12 h. The excess of solvent was distilled off and the solid hydrochloride salt that separated was collected by filtration, suspended in water and neutralized by aqueous sodium carbonate solution to yield the free base. The solution was filtered, the solid washed with water, dried and recrystallized from ethyl acetate to give the title compound (74% yield, mp 385 K). The compound was recrystallized by slow evaporation from 1:1 mixture of ethyl acetate and methanol, yielding pale yellow blocks.

S3. Refinement

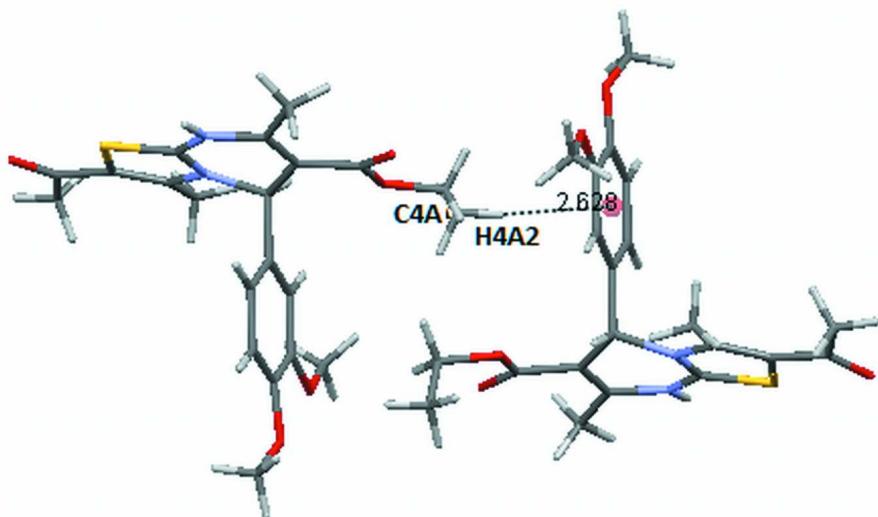

The H atoms were placed at calculated positions in the riding-model approximation with C—H = 0.95 Å, 1.00 Å and 0.96 Å for aromatic, methyne and methyl H-atoms respectively, with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methyl H atoms and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for other hydrogen atoms.

**Figure 1**

 $\Delta\rho_{\min} = -0.39 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg3 is the centroid of the C9B—C14B ring.
