Edited by E. R. T. Tiekkink, University of Malaya, Malaysia

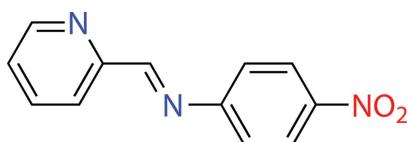

The title compound,  $C_{12}H_9N_3O_2$ , adopts an *E* conformation at the imine double bond. The pyridyl ring makes a dihedral angle of  $47.78(5)^\circ$  with the benzene ring, indicating the molecule is twisted. In the crystal, molecules are  $\pi$ – $\pi$  stacked into columns parallel to [100], with an interplanar separation of  $3.8537(8)$  Å, corresponding to the length of the *a* axis. The chains are further linked via weak C–H···O and C–H···N hydrogen bonds, forming two-dimensional sheets parallel to (010). The sheets interact by van der Waals interactions.

**Keywords:** crystal structure; hydrogen bonds; Schiff base;  $\pi$ – $\pi$  stacking.

**CCDC reference:** 1423407

## Crystal structure of 4-nitro-N-[(pyridin-2-yl)methylidene]aniline

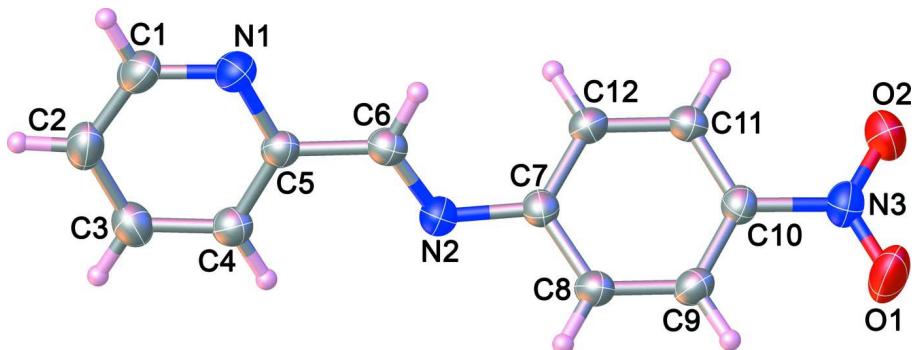

Watcharin Saphu and Kittipong Chainok

### S1. Synthesis and crystallization

At room temperature, 2-pyridinecarboxaldehyde (1.90 ml, 0.02 mol) was added to a benzene solution (100 ml) of 4-nitro-aniline (2.76 g, 0.02 mol), with a few drops of acetic acid added as catalyst. The reaction mixture was stirred under reflux at 110 °C. After 6 h of reflux, the yellow solution was neutralized with Na<sub>2</sub>CO<sub>3</sub> (2 mmol), filtered, and concentrated to dryness *in vacuo*. The residue was recrystallized from a mixture of CH<sub>2</sub>Cl<sub>2</sub> and petroleum ether (2:1, *v/v*) to give light-yellow crystalline solid of (I).

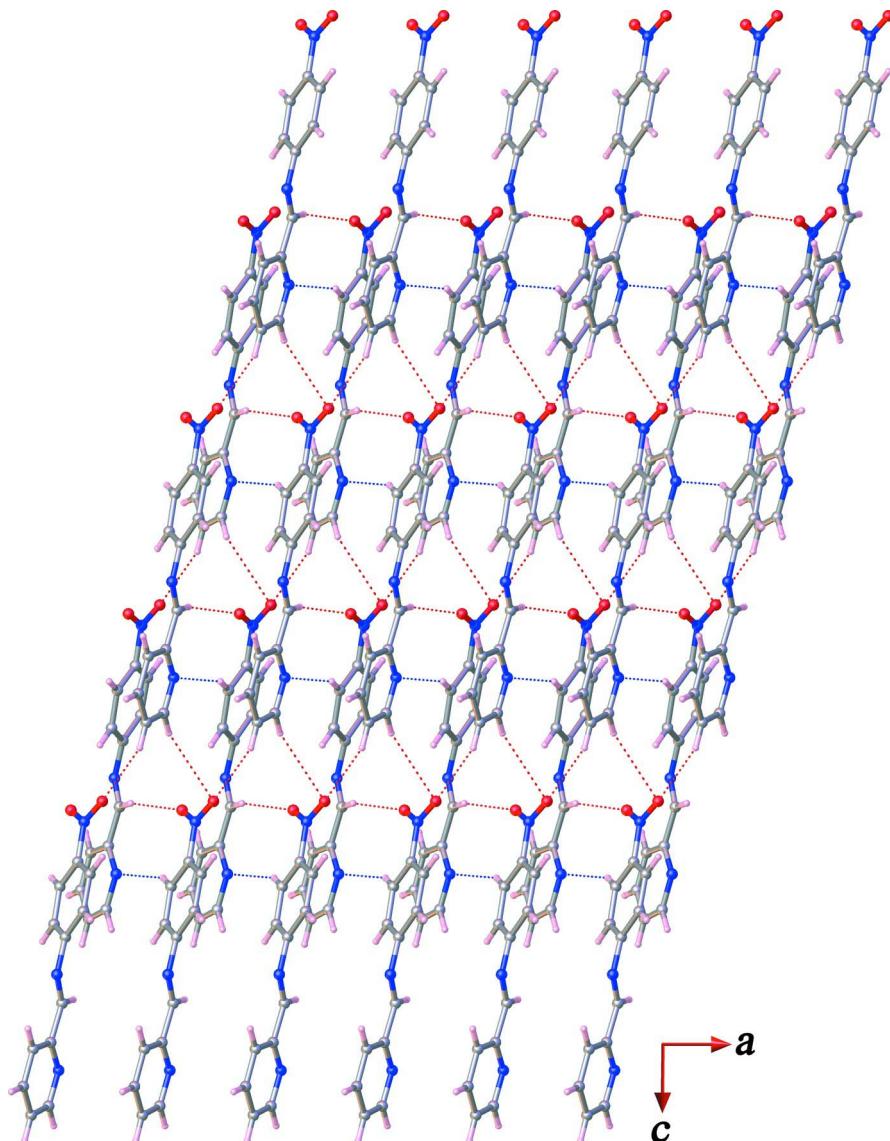

### S2. Refinement

The C-bound hydrogen atoms were placed in geometrically idealized positions and constrained to ride on their parent atom positions with a C—H distances of 0.93 Å, and with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

**Figure 1**

The molecular structure of (I), showing 35% probability displacement ellipsoids and atom labels.

**Figure 2**

A packing view of (I) along (010). Hydrogen bonds are shown as dashed lines.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
